# **Foreword**

This is version 5.0 of the Linux Standard Base Core Specification, Generic Part. This specification is one of a series of volumes under the collective title *Linux Standard Base*:

- Common
- Core
- Desktop
- Languages
- Imaging

Note that the Core and Desktop volumes consist of a generic volume augmented by an architecture-specific volume.

# **Status of this Document**

This is a released specification, version 5.0. Other documents may supersede or augment this specification.

A list of current released Linux Standard Base (LSB) specifications is available at http://refspecs.linuxbase.org (http://refspecs.linuxbase.org/).

If you wish to make comments regarding this document in a manner that is tracked by the LSB project, please submit them using our public bug database at http://bugs.linux-base.org. Please enter your feedback, carefully indicating the title of the section for which you are submitting feedback, and the volume and version of the specification where you found the problem, quoting the incorrect text if appropriate. If you are suggesting a new feature, please indicate what the problem you are trying to solve is. That is more important than the solution, in fact.

If you do not have or wish to create a bug database account then you can also e-mail feedback to <lsb-discuss@lists.linuxfoundation.org> (subscribe (http://lists.linuxfoundation.org/mailman/listinfo/lsb-discuss), archives (http://lists.linuxfoundation.org/pipermail/lsb-discuss/)), and arrangements will be made to transpose the comments to our public bug database.

# Introduction

The LSB defines a binary interface for application programs that are compiled and packaged for LSB-conforming implementations on many different hardware architectures. A binary specification must include information specific to the computer processor architecture for which it is intended. To avoid the complexity of conditional descriptions, the specification has instead been divided into generic parts which are augmented by one of several architecture-specific parts, depending on the target processor architecture; the generic part will indicate when reference must be made to the architecture part, and vice

This document should be used in conjunction with the documents it references. This document enumerates the system components it includes, but descriptions of those components may be included entirely or partly in this document, partly in other documents, or entirely in other reference documents. For example, the section that describes system service routines includes a list of the system routines supported in this interface, formal declarations of the data structures they use that are visible to applications, and a pointer to the underlying referenced specification for information about the syntax and semantics of each call. Only those routines not described in standards referenced by this document, or extensions to those standards, are described in the detail. Information referenced in this way is as much a part of this document as is the information explicitly included here.

The specification carries a version number of either the form x.y or x.y.z. This version number carries the following meaning:

- 1. The first number (x) is the major version number. Versions sharing the same major version number shall be compatible in a backwards direction; that is, a newer version shall be compatible with an older version. Any deletion of a library results in a new major version number. Interfaces marked as deprecated may be removed from the specification at a major version change.
- 2. The second number (y) is the minor version number. Libraries and individual interfaces may be added, but not removed. Interfaces may be marked as deprecated at a minor version change. Other minor changes may be permitted at the discretion of the LSB workgroup.
- 3. The third number (z), if present, is the editorial level. Only editorial changes should be included in such versions.

Since this specification is a descriptive Application Binary Interface, and not a source level API specification, it is not possible to make a guarantee of 100% backward compatibility between major releases. However, it is the intent that those parts of the binary interface that are visible in the source level API will remain backward compatible from version to version, except where a feature marked as "Deprecated" in one release may be removed from a future release. Implementors are strongly encouraged to make use of symbol versioning to permit simultaneous support of applications conforming to different releases of this specification.

LSB is a trademark of the Linux Foundation. Developers of applications or implementations interested in using the trademark should see the Linux Foundation Certification Policy for details.

# I Introductory Elements

# 1 Scope

### 1.1 General

The Linux Standard Base (LSB) defines a system interface for compiled applications and a minimal environment for support of installation scripts. Its purpose is to enable a uniform industry standard environment for high-volume applications conforming to the LSB.

These specifications are composed of two basic parts: a common part describing those parts of the interface that remain constant across all implementations of the LSB, and an architecture-specific part describing the parts of the interface that vary by processor architecture. Together, the common part and the relevant architecture-specific part for a single hardware architecture provide a complete interface specification for compiled application programs on systems that share a common hardware architecture.

The LSB contains both a set of Application Program Interfaces (APIs) and Application Binary Interfaces (ABIs). APIs may appear in the source code of portable applications, while the compiled binary of that application may use the larger set of ABIs. A conforming implementation provides all of the ABIs listed here. The compilation system may replace (e.g. by macro definition) certain APIs with calls to one or more of the underlying binary interfaces, and may insert calls to binary interfaces as needed.

The LSB is primarily a binary interface definition. Not all of the source level APIs available to applications may be contained in this specification.

# 1.2 Module Specific Scope

This is the common part of the Core module of the Linux Standard Base (LSB), LSB Core - Generic. This module provides the fundamental system interfaces, libraries, and runtime environment upon which all conforming applications and libraries depend.

LSB Core - Generic, the common part, should be used in conjunction with an architecture-specific part. Whenever a section of the common part is supplemented by architecture-specific information, the common part includes a reference to the architecture-specific part. Architecture-specific parts of the LSB Core Specification may also contain additional information that is not referenced in the common part.

Interfaces described in this part of the LSB Core Specification are mandatory except where explicitly listed otherwise. Interfaces described in the LSB Core module are supplemented by other LSB modules. All other modules depend on the presence of LSB Core.

# 2 References

### 2.1 Normative References

The following specifications are incorporated by reference into this specification. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced specification (including any amendments) applies.

**Note:** Where copies of a referenced specification are available on the World Wide Web, a Uniform Resource Locator (URL) is given, for informative purposes only. Such URL might at any given time resolve to a more recent copy of the specification, or be out of date (not resolve). Reference copies of specifications at the revision level indicated may be found at the Linux Foundation's Reference Specifications (http://refspecs.linuxbase.org) site.

# 3 Requirements

### 3.1 Relevant Libraries

The libraries listed in <u>Table 3-1</u> shall be available on a Linux Standard Base system, with the specified runtime names. The libraries listed in <u>Table 3-2</u> are architecture specific, but shall be available on all LSB conforming systems. This list may be supplemented or amended by the relevant architecture specific part of the LSB Core Specification.

**Table 3-1 Standard Library Names** 

Library	Runtime Name
liberypt	libcrypt.so.1
libdl	libdl.so.2
libgcc_s	libgcc_s.so.1
libncurses	libncurses.so.5
libncursesw	libncursesw.so.5
libnspr4	libnspr4.so
libnss3	libnss3.so
libpam	libpam.so.0
libpthread	libpthread.so.0
librt	librt.so.1
libssl3	libssl3.so
libstdcxx	libstdc++.so.6
libutil	libutil.so.1
libz	libz.so.1

Table 3-2 Standard Library Names defined in the Architecture Specific Parts of the LSB Core Specification

Library	Runtime Name	
libc	See architecture specific part.	
libm	See architecture specific part.	
proginterp	See architecture specific part.	

These libraries will be in an implementation-defined directory which the dynamic linker shall search by default.

# 3.2 LSB Implementation Conformance

A conforming implementation is necessarily architecture specific, and must provide the interfaces specified by both the generic LSB Core specification (LSB Core - Generic) and the relevant architecture specific part of the LSB Core Specification.

**Rationale:** An implementation must provide *at least* the interfaces specified in these specifications. It may also provide additional interfaces.

A conforming implementation shall satisfy the following requirements:

A processor architecture represents a family of related processors which may not have
identical feature sets. The architecture specific parts of the LSB Core Specification
that supplement this specification for a given target processor architecture describe a
minimum acceptable processor. The implementation shall provide all features of this
processor, whether in hardware or through emulation transparent to the application.

- The implementation shall be capable of executing compiled applications having the format and using the system interfaces described in this specification.
- The implementation shall provide libraries containing the interfaces specified by this
  specification, and shall provide a dynamic linking mechanism that allows these interfaces to be attached to applications at runtime. All the interfaces shall behave as specified in this specification.
- The map of virtual memory provided by the implementation shall conform to the requirements of this specification.
- The implementation's low-level behavior with respect to function call linkage, system traps, signals, and other such activities shall conform to the formats described in this specification.
- The implementation shall provide all of the mandatory interfaces in their entirety.
- The implementation may provide one or more of the optional interfaces. Each optional interface that is provided shall be provided in its entirety. The product documentation shall state which optional interfaces are provided.
- The implementation shall provide all files and utilities specified as part of this specification in the format defined here and in other documents normatively included by reference. All commands and utilities shall behave as required by this specification. The implementation shall also provide all mandatory components of an application's runtime environment that are included or referenced in this specification.
- The implementation, when provided with standard data formats and values at a named interface, shall provide the behavior defined for those values and data formats at that interface. However, a conforming implementation may consist of components which are separately packaged and/or sold. For example, a vendor of a conforming implementation might sell the hardware, operating system, and windowing system as separately packaged items.
- The implementation may provide additional interfaces with different names. It may also provide additional behavior corresponding to data values outside the standard ranges, for standard named interfaces.

# 3.3 LSB Application Conformance

A conforming application containing object files is necessarily architecture specific, and must conform to both the generic LSB Core specification (LSB Core - Generic) and the relevant architecture specific part of the LSB Core Specification. A conforming application which contains no object files may be architecture neutral. Architecture neutral applications shall conform only to the requirements of the generic LSB Core specification (LSB Core - Generic).

A conforming application shall satisfy the following requirements:

- Executable files shall be either object files in the format defined in the Object Format section of this specification, or script files in a scripting language where the interpreter is required by this specification.
- Object files shall participate in dynamic linking as defined in the Program Loading and Linking section of this specification.
- Object files shall employ only the instructions, traps, and other low-level facilities defined as being for use by applications in the Low-Level System Information section of this specification
- If the application requires any optional interface defined in this specification in order to be installed or to execute successfully, the requirement for that optional interface shall be stated in the application's documentation.
- The application shall not use any interface or data format that is not required to be provided by a conforming implementation, unless such an interface or data format is supplied by another application through direct invocation of that application during

execution. The other application must also be a conforming application, and the use of such interface or data format, as well as its source (in other words, the other conforming application), shall be identified in the documentation of the application.

• The application shall not use any values for a named interface that are reserved for vendor extensions.

A strictly conforming application shall not require or use any interface, facility, or implementation-defined extension not defined in this specification in order to be installed or to execute successfully.

# 4 Terms and Definitions

For the purposes of this document, the terms given in *ISO/IEC Directives, Part 2, Annex H* and the following apply.

#### archLSB

Some LSB specification documents have both a generic, architecture-neutral part and an architecture-specific part. The latter describes elements whose definitions may be unique to a particular processor architecture. The term archLSB may be used in the generic part to refer to the corresponding section of the architecture-specific part.

### Binary Standard, ABI

The total set of interfaces that are available to be used in the compiled binary code of a conforming application, including the run-time details such as calling conventions, binary format, C++ name mangling, etc.

#### Implementation-defined

Describes a value or behavior that is not defined by this document but is selected by an implementor. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations. The implementor shall document such a value or behavior so that it can be used correctly by an application.

#### Shell Script

A file that is read by an interpreter (e.g., awk). The first line of the shell script includes a reference to its interpreter binary.

### Source Standard, API

The total set of interfaces that are available to be used in the source code of a conforming application. Due to translations, the Binary Standard and the Source Standard may contain some different interfaces.

#### Undefined

Describes the nature of a value or behavior not defined by this document which results from use of an invalid program construct or invalid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

### Unspecified

Describes the nature of a value or behavior not specified by this document which results from use of a valid program construct or valid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

In addition, for the portions of this specification which build on IEEE Std 1003.1-2001, the definitions given in *IEEE Std 1003.1-2001*, *Base Definitions*, *Chapter 3* apply.

# **5 Documentation Conventions**

Throughout this document, the following typographic conventions are used:

function()

the name of a function

#### command

the name of a command or utility

CONSTANT

a constant value

parameter

a parameter

variable

a variable

Throughout this specification, several tables of interfaces are presented. Each entry in these tables has the following format:

name

the name of the interface

(symver)

An optional symbol version identifier, if required.

[refno]

A reference number indexing the table of referenced specifications that follows this table.

For example,

forkpty(GLIBC\_2.0) [SUSv4]

refers to the interface named forkpty() with symbol version GLIBC\_2.0 that is defined in the reference indicated by the tag SUSv4.

**Note:** For symbols with versions which differ between architectures, the symbol versions are defined in the architecture specific parts of of this module specification only. In the generic part, they will appear without symbol versions.

# 6 Relationship To ISO/IEC 9945 POSIX

This specification includes many interfaces described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. Unless otherwise specified, such interfaces should behave exactly as described in that specification. Any conflict between the requirements described here and the <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> standard is unintentional, except as explicitly noted otherwise.

**Note:** In addition to the differences noted in this specification, a report, *ISO/IEC TR 24715-Technical Report on the Conflicts Between the ISO/IEC 9945 (POSIX) Standard and the Linux Standard Base Specification (LSB)*, identifies the differences between edition 3.1 of this specification and *POSIX 1003.1-2001 (ISO/IEC 9945-2003)* (more precisely, POSIX 2001 plus the first two corrigenda, informally known as the 2004 edition). It is the long term plan of the Linux Foundation to converge the LSB Core specification with the ISO/IEC POSIX specification.

The LSB Specification Authority is responsible for deciding the meaning of conformance to normative referenced standards in the LSB context. Problem reports regarding underlying or referenced standards in any other context will be referred to the relevant maintenance body for that standard.

# 7 Relationship To Other Linux Foundation Specifications

The LSB is the base for several other specification projects under the umbrella of the Linux Foundation (LF). This specification is the foundation, and other specifications build on the interfaces defined here. However, beyond those specifications listed as Normative References, this specification has no dependencies on other LF projects.

ISO/IEC 23360 corresponds to an earlier edition of this specification (version 3.1), published as an ISO/IEC standard in 2006 after submission by the Linux Foundation. The ISO edition is also the subject of the technical report ISO/IEC TR 24715 referenced in the previous chapter.

# II Executable And Linking Format (ELF)

# 8 Introduction

Executable and Linking Format (ELF) defines the object format for compiled applications. This specification supplements the information found in <a href="System V ABI Update">System V ABI Update</a> and is intended to document additions made since the publication of that document.

# 9 Low Level System Information

# 9.1 Operating System Interface

LSB-conforming applications shall assume that stack, heap and other allocated memory regions will be non-executable. The application must take steps to make them executable if needed.

# 9.2 Machine Interface

# 9.2.1 Data Representation

LSB-conforming applications shall use the data representation as defined in the Arcitecture specific ELF documents.

# 9.2.1.1 Fundamental Types

In addition to the fundamental types specified in the relevant architecture specific part of the LSB Core Specification, a 1 byte data type is defined here.

**Table 9-1 Scalar Types** 

Table 9-1 Scalar Types					
Туре	С	C++	sizeof	Align- ment (bytes)	Architec- ture Rep- resenta- tion
Integral	_Bool	bool	1	1	byte

# 10 Object Format

# 10.1 Object Files

LSB-conforming implementations shall support the Executable and Linking Format (ELF) object file format as defined by the following documents:

- System V ABI
- System V ABI Update
- the relevant architecture specific ABI supplement.
- · this specification
- the relevant architecture specific part of the LSB Core Specification

Conforming implementations may also support other unspecified object file formats.

### 10.2 Sections

### 10.2.1 Introduction

As described in **System V ABI**, an ELF object file contains a number of sections.

# 10.2.2 Sections Types

The section header table is an array of Elf32\_Shdr or Elf64\_Shdr structures as described in <u>System V ABI</u>. The *sh\_type* member shall be either a value from <u>Table 10-1</u>, drawn from the System V ABI, or one of the additional values specified in <u>Table 10-2</u>.

A section header's *sh\_type* member specifies the sections's semantics.

### 10.2.2.1 ELF Section Types

The following section types are defined in the <u>System V ABI</u> and the <u>System V ABI Update</u>.

**Table 10-1 ELF Section Types** 

Name	Value	Description
SHT_DYNAMIC	0x6	The section holds information for dynamic linking. Currently, an object file shall have only one dynamic section, but this restriction may be relaxed in the future. See `Dynamic Section' in Chapter 5 of System V ABI Update for details.
SHT_DYNSYM	0xb	This section holds a minimal set of symbols adequate for dynamic linking. See also SHT_SYMTAB. Currently, an object file may have either a section of SHT_SYMTAB type or a section of SHT_DYNSYM type, but not both.

	1	
		This restriction may be relaxed in the future.
SHT_FINI_ARRAY	0xf	This section contains an array of pointers to termination functions, as described in `Initialization and Termination Functions' in Chapter 5 of System V ABI Update. Each pointer in the array is taken as a parameterless procedure with a void return.
SHT_HASH	0x5	The section holds a symbol hash table. Currently, an object file shall have only one hash table, but this restriction may be relaxed in the future. See 'Hash Table' in Chapter 5 of System V ABI Update for details.
SHT_INIT_ARRAY	0xe	This section contains an array of pointers to initialization functions, as described in `Initialization and Termination Functions' in Chapter 5 of System V ABI Update. Each pointer in the array is taken as a parameterless procedure with a void return.
SHT_NOBITS	0x8	A section of this type occupies no space in the file but otherwise resembles SHT_PROGBITS. Although this section contains no bytes, the sh_offset member contains the conceptual file offset.
SHT_NOTE	0x7	The section holds information that marks the file in some way. See `Note Section' in Chapter 5 of System V ABI Update for details.
SHT_NULL	0x0	This value marks the section header as inactive; it does not have an associated section. Other members of the section header have undefined values.
SHT_PREINIT_ARRAY	0x10	This section contains an array of pointers to functions that are invoked be-

		fore all other initialization functions, as described in Initialization and Termination Functions' in Chapter 5 of System V ABI Update. Each pointer in the array is taken as a parameterless proceure with a void return.
SHT_PROGBITS	0x1	The section holds information defined by the program, whose format and meaning are determined solely by the program.
SHT_REL	0x9	The section holds relocation entries without explicit addends, such as type Elf32_Rel for the 32-bit class of object files or type Elf64_Rel for the 64-bit class of object files. An object file may have multiple relocation sections. See `Relocation' in Chapter 4 of System V ABI Update for details.
SHT_RELA	0x4	The section holds relocation entries with explicit addends, such as type Elf32_Rela for the 32-bit class of object files or type Elf64_Rela for the 64-bit class of object files. An object file may have multiple relocation sections. See `Relocation' in Chapter 4 of System V ABI Update for details.
SHT_STRTAB	0x3	The section holds a string table. An object file may have multiple string table sections. See `String Table' in Chapter 4 of System V ABI Update for details.
SHT_SYMTAB	0x2	This section holds a symbol table. Currently, an object file may have either a section of SHT_SYMTAB type or a section of SHT_DYN-SYM type, but not both. This restriction may be relaxed in the future. Typically, SHT_SYMTAB provides symbols for link

	editing, though it may also be used for dynamic linking. As a complete symbol table, it may con- tain many symbols unne- cessary for dynamic link-
	ing.

# 10.2.2.2 Additional Section Types

The following additional section types are defined here.

**Table 10-2 Additional Section Types** 

Name	Value	Description
SHT_GNU_verdef	0x6ffffffd	This section contains the symbol versions that are provided.
SHT_GNU_verneed	0x6ffffffe	This section contains the symbol versions that are required.
SHT_GNU_versym	0x6fffffff	This section contains the Symbol Version Table.

# 10.3 Special Sections

# 10.3.1 Special Sections

Various sections hold program and control information. Sections in the lists below are used by the system and have the indicated types and attributes.

# 10.3.1.1 ELF Special Sections

The following sections are defined in the **System V ABI** and the **System V ABI Update**.

**Table 10-3 ELF Special Sections** 

Name	Туре	Attributes
.bss	SHT_NOBITS	SHF_ALLOC+SHF_WRI TE
.comment	SHT_PROGBITS	SHF_MERGE+SHF_ST RINGS
.data	SHT_PROGBITS	SHF_ALLOC+SHF_WRI TE
.data1	SHT_PROGBITS	SHF_ALLOC+SHF_WRI TE
.debug	SHT_PROGBITS	0
.dynamic	SHT_DYNAMIC	SHF_ALLOC+SHF_WRI TE
.dynstr	SHT_STRTAB	SHF_ALLOC
.dynsym	SHT_DYNSYM	SHF_ALLOC
.fini	SHT_PROGBITS	SHF_ALLOC+SHF_EX- ECINSTR
.fini_array	SHT_FINI_ARRAY	SHF_ALLOC+SHF_WRI TE
.hash	SHT_HASH	SHF_ALLOC

.init	SHT_PROGBITS	SHF_ALLOC+SHF_EX- ECINSTR
.init_array	SHT_INIT_ARRAY	SHF_ALLOC+SHF_WR ITE
.interp	SHT_PROGBITS	SHF_ALLOC
.line	SHT_PROGBITS	0
.note	SHT_NOTE	0
.preinit_array	SHT_PREINIT_ARRAY	SHF_ALLOC+SHF_WRI TE
.rodata	SHT_PROGBITS	SHF_ALLOC+SHF_ME RGE+SHF_STRINGS
.rodata1	SHT_PROGBITS	SHF_ALLOC+SHF_ME RGE+SHF_STRINGS
.shstrtab	SHT_STRTAB	0
.strtab	SHT_STRTAB	SHF_ALLOC
.symtab	SHT_SYMTAB	SHF_ALLOC
.tbss	SHT_NOBITS	SHF_ALLOC+SHF_WRI TE+SHF_TLS
.tdata	SHT_PROGBITS	SHF_ALLOC+SHF_WRI TE+SHF_TLS
.text	SHT_PROGBITS	SHF_ALLOC+SHF_EX- ECINSTR

#### .bss

This section holds data that contributes to the program's memory image. The program may treat this data as uninitialized. However, the system shall initialize this data with zeroes when the program begins to run. The section occupies no file space, as indicated by the section type, SHT\_NOBITS.

### .comment

This section holds version control information.

#### .data

This section holds initialized data that contribute to the program's memory image.

### .data1

This section holds initialized data that contribute to the program's memory image.

#### .debug

This section holds information for symbolic debugging. The contents are unspecified. All section names with the prefix .debug hold information for symbolic debugging. The contents of these sections are unspecified.

#### .dynamic

This section holds dynamic linking information. The section's attributes will include the SHF\_ALLOC bit. Whether the SHF\_WRITE bit is set is processor specific. See Chapter 5 of System V ABI Update for more information.

### .dynstr

This section holds strings needed for dynamic linking, most commonly the strings that represent the names associated with symbol table entries. See Chapter 5 of

System V ABI Update for more information.

#### .dynsym

This section holds the dynamic linking symbol table, as described in `Symbol Table' of System V ABI Update.

#### .fini

This section holds executable instructions that contribute to the process termination code. That is, when a program exits normally, the system arranges to execute the code in this section.

#### .fini\_array

This section holds an array of function pointers that contributes to a single termination array for the executable or shared object containing the section.

#### .hash

This section holds a symbol hash table. See `Hash Table' in Chapter 5 of System V ABI Update for more information.

#### .init

This section holds executable instructions that contribute to the process initialization code. When a program starts to run, the system arranges to execute the code in this section before calling the main program entry point (called main for C programs).

#### .init\_array

This section holds an array of function pointers that contributes to a single initialization array for the executable or shared object containing the section.

### .interp

This section holds the path name of a program interpreter. If the file has a loadable segment that includes relocation, the sections' attributes will include the SHF\_AL-LOC bit; otherwise, that bit will be off. See Chapter 5 of System V ABI Update for more information.

#### .line

This section holds line number information for symbolic debugging, which describes the correspondence between the source program and the machine code. The contents are unspecified.

#### .note

This section holds information in the format that 'Note Section' in Chapter 5 of System V ABI Update describes.

### .preinit\_array

This section holds an array of function pointers that contributes to a single pre-initialization array for the executable or shared object containing the section.

#### .rodata

This section holds read-only data that typically contribute to a non-writable segment in the process image. See 'Program Header' in Chapter 5 of System V ABI Update for more information.

#### .rodata1

This section holds read-only data that typically contribute to a non-writable seg-

ment in the process image. See 'Program Header' in Chapter 5 of System V ABI Update for more information.

#### .shstrtab

This section holds section names.

#### .strtab

This section holds strings, most commonly the strings that represent the names associated with symbol table entries. If the file has a loadable segment that includes the symbol string table, the section's attributes will include the SHF\_ALLOC bit; otherwise, that bit will be off.

#### .symtab

This section holds a symbol table, as `Symbol Table' in Chapter 4 of System V ABI Update describes. If the file has a loadable segment that includes the symbol table, the section's attributes will include the SHF\_ALLOC bit; otherwise, that bit will be off.

#### .tbss

This section holds uninitialized thread-local data that contribute to the program's memory image. By definition, the system initializes the data with zeros when the data is instantiated for each new execution flow. The section occupies no file space, as indicated by the section type, SHT\_NOBITS. Implementations need not support thread-local storage.

#### .tdata

This section holds initialized thread-local data that contributes to the program's memory image. A copy of its contents is instantiated by the system for each new execution flow. Implementations need not support thread-local storage.

#### .text

This section holds the 'text', or executable instructions, of a program.

### 10.3.1.2 Additional Special Sections

Object files in an LSB conforming application may also contain one or more of the additional special sections described below.

**Table 10-4 Additional Special Sections** 

Name	Туре	Attributes
.ctors	SHT_PROGBITS	SHF_ALLOC+SHF_WRI TE
.data.rel.ro	SHT_PROGBITS	SHF_ALLOC+SHF_WRI TE
.dtors	SHT_PROGBITS	SHF_ALLOC+SHF_WRI TE
.eh_frame	SHT_PROGBITS	SHF_ALLOC
.eh_frame_hdr	SHT_PROGBITS	SHF_ALLOC
.gcc_except_table	SHT_PROGBITS	SHF_ALLOC
.gnu.version	SHT_GNU_versym	SHF_ALLOC
.gnu.version_d	SHT_GNU_verdef	SHF_ALLOC
.gnu.version_r	SHT_GNU_verneed	SHF_ALLOC
.got.plt	SHT_PROGBITS	SHF_ALLOC+SHF_WRI

		TE
.jcr	SHT_PROGBITS	SHF_ALLOC+SHF_WRI TE
.note.ABI-tag	SHT_NOTE	SHF_ALLOC
.stab	SHT_PROGBITS	0
.stabstr	SHT_STRTAB	0

#### .ctors

This section contains a list of global constructor function pointers.

#### .data.rel.ro

This section holds initialized data that contribute to the program's memory image. This section may be made read-only after relocations have been applied.

#### .dtors

This section contains a list of global destructor function pointers.

#### .eh\_frame

This section contains information necessary for frame unwinding during exception handling. See <u>Section 10.6.1</u>.

#### .eh\_frame\_hdr

This section contains a pointer to the .eh\_frame section which is accessible to the runtime support code of a C++ application. This section may also contain a binary search table which may be used by the runtime support code to more efficiently access records in the .eh\_frame section. See <u>Section 10.6.2</u>.

#### .gcc\_except\_table

This section holds Language Specific Data.

#### .gnu.version

This section contains the Symbol Version Table. See Section 10.7.2.

### .gnu.version\_d

This section contains the Version Definitions. See Section 10.7.3.

#### .gnu.version\_r

This section contains the Version Requirements. See <u>Section 10.7.4</u>.

#### .got.plt

This section holds the read-only portion of the GLobal Offset Table. This section may be made read-only after relocations have been applied.

### .jcr

This section contains information necessary for registering compiled Java classes. The contents are compiler-specific and used by compiler initialization functions.

### .note.ABI-tag

Specify ABI details. See Section 10.8.

#### .stab

This section contains debugging information. The contents are not specified as part of the LSB.

.stabstr

This section contains strings associated with the debugging infomation contained in the .stab section.

# 10.4 Symbol Mapping

# 10.4.1 Introduction

Symbols in a source program are translated by the compilation system into symbols that exist in the object file.

# 10.4.1.1 C Language

External C symbols shall be unchanged in an object file's symbol table.

### 10.5 DWARF Extensions

The LSB does not specify debugging information, however, some additional sections contain information which is encoded using the the encoding as specified by <u>DWARF</u> <u>Debugging Information Format, Version 4</u> with extensions defined here.

# 10.5.1 DWARF Exception Header Encoding

The DWARF Exception Header Encoding is used to describe the type of data used in the .eh\_frame and .eh\_frame\_hdr section. The upper 4 bits indicate how the value is to be applied. The lower 4 bits indicate the format of the data.

Table 10-5 DWARF Exception Header value format

Name	Value	Meaning
DW_EH_PE_absptr	0x00	The Value is a literal pointer whose size is determined by the architecture.
DW_EH_PE_uleb128	0x01	Unsigned value is encoded using the Little Endian Base 128 (LEB128) as defined by DWARF Debugging Information Format, Version 4.
DW_EH_PE_udata2	0x02	A 2 bytes unsigned value.
DW_EH_PE_udata4	0x03	A 4 bytes unsigned value.
DW_EH_PE_udata8	0x04	An 8 bytes unsigned value.
DW_EH_PE_sleb128	0x09	Signed value is encoded using the Little Endian Base 128 (LEB128) as defined by <u>DWARF</u> <u>Debugging Information</u> <u>Format, Version 4</u> .
DW_EH_PE_sdata2	0x0A	A 2 bytes signed value.
DW_EH_PE_sdata4	0x0B	A 4 bytes signed value.
DW_EH_PE_sdata8	0x0C	An 8 bytes signed value.

**Table 10-6 DWARF Exception Header application** 

Name	Value	Meaning
DW_EH_PE_pcrel	0x10	Value is relative to the current program counter.
DW_EH_PE_textrel	0x20	Value is relative to the beginning of the .text section.
DW_EH_PE_datarel	0x30	Value is relative to the beginning of the .got or .eh_frame_hdr section.
DW_EH_PE_funcrel	0x40	Value is relative to the beginning of the function.
DW_EH_PE_aligned	0x50	Value is aligned to an address unit sized boundary.

One special encoding, 0xff (DW\_EH\_PE\_omit), shall be used to indicate that no value ispresent.

# 10.5.2 DWARF CFI Extensions

In addition to the Call Frame Instructions defined in section 6.4.2 of <u>DWARF</u> <u>Debugging Information Format</u>, <u>Version 4</u>, the following additional Call Frame Instructions may also be used.

**Table 10-7 Additional DWARF Call Frame Instructions** 

Name	Value	Meaning
DW_CFA_GNU_args_siz e	0x2e	The DW_CFA_GNU_args_siz e instruction takes an unsigned LEB128 operand representing an argument size. This instruction specifies the total of the size of the arguments which have been pushed onto the stack.
DW_CFA_GNU_negativ e_offset_extended	0x2f	The DW_CFA_def_cfa_sf instruction takes two operands: an unsigned LEB128 value representing a register number and an unsigned LEB128 which represents the magnitude of the offset. This instruction is identical to DW_CFA_offset_extende d_sf except that the operand is subtracted to produce the offset. This instructions is obsoleted by DW_CFA_offset_extende

	l d e <del>f</del>
	1 U SI.

# 10.6 Exception Frames

When using languages that support exceptions, such as C++, additional information must be provided to the runtime environment that describes the call frames that must be unwound during the processing of an exception. This information is contained in the special sections .eh\_frame and .eh\_framehdr.

**Note:** The format of the .eh\_frame section is similar in format and purpose to the .de-bug\_frame section which is specified in <u>DWARF Debugging Information Format</u>, <u>Version 4</u>. Readers are advised that there are some subtle difference, and care should be taken when comparing the two sections.

# 10.6.1 The .eh frame section

The .eh\_frame section shall contain 1 or more Call Frame Information (CFI) records. The number of records present shall be determined by size of the section as contained in the section header. Each CFI record contains a Common Information Entry (CIE) record followed by 1 or more Frame Description Entry (FDE) records. Both CIEs and FDEs shall be aligned to an addressing unit sized boundary.

**Table 10-8 Call Frame Information Format** 

Common Information Entry Record	
Frame Description Entry Record(s)	

### 10.6.1.1 The Common Information Entry Format

**Table 10-9 Common Information Entry Format** 

Length	Required
Extended Length	Optional
CIE ID	Required
Version	Required
Augmentation String	Required
Code Alignment Factor	Required
Data Alignment Factor	Required
Return Address Register	Required
Augmentation Data Length	Optional
Augmentation Data	Optional
Initial Instructions	Required
Padding	

#### Length

A 4 byte unsigned value indicating the length in bytes of the CIE structure, not including the *Length* field itself. If *Length* contains the value 0xffffffff, then the length is contained in the *Extended Length* field. If *Length* contains the value 0, then this CIE shall be considered a terminator and processing shall end.

#### Extended Length

A 8 byte unsigned value indicating the length in bytes of the CIE structure, not including the *Length* and *Extended Length* fields themselves. This field is not present unless the *Length* field contains the value 0xffffffff.

### CIE ID

A 4 byte unsigned value that is used to distinguish CIE records from FDE records. This value shall always be 0, which indicates this record is a CIE.

#### Version

A 1 byte value that identifies the version number of the frame information structure. This value shall be 1.

### Augmentation String

This value is a NUL terminated string that identifies the augmentation to the CIE or to the FDEs associated with this CIE. A zero length string indicates that no augmentation data is present. The augmentation string is case sensitive and shall be interpreted as described below.

#### Code Alignment Factor

An unsigned LEB128 encoded value that is factored out of all advance location instructions that are associated with this CIE or its FDEs. This value shall be multiplied by the delta argument of an adavance location instruction to obtain the new location value.

### Data Alignment Factor

A signed LEB128 encoded value that is factored out of all offset instructions that are associated with this CIE or its FDEs. This value shall be multiplied by the register offset argument of an offset instruction to obtain the new offset value.

### Augmentation Length

An unsigned LEB128 encoded value indicating the length in bytes of the Augmentation Data. This field is only present if the Augmentation String contains the character 'z'.

#### Augmentation Data

A block of data whose contents are defined by the contents of the Augmentation String as described below. This field is only present if the Augmentation String contains the character 'z'. The size of this data is given by the Augentation Length.

### Initial Instructions

Initial set of Call Frame Instructions. The number of instructions is determined by the remaining space in the CIE record.

### Padding

Extra bytes to align the CIE structure to an addressing unit size boundary.

### 10.6.1.1.1 Augmentation String Format

The Agumentation String indicates the presence of some optional fields, and how those fields should be interpreted. This string is case sensitive. Each character in the augmentation string in the CIE can be interpreted as below:

'z'

A 'z' may be present as the first character of the string. If present, the Augmentation Data field shall be present. The contents of the Augmentation Data shall be intepreted according to other characters in the Augmentation String.

'L'

A 'L' may be present at any position after the first character of the string. This character may only be present if 'z' is the first character of the string. If present, it

indicates the presence of one argument in the Augmentation Data of the CIE, and a corresponding argument in the Augmentation Data of the FDE. The argument in the Augmentation Data of the CIE is 1-byte and represents the pointer encoding used for the argument in the Augmentation Data of the FDE, which is the address of a language-specific data area (LSDA). The size of the LSDA pointer is specified by the pointer encoding used.

'P'

A 'P' may be present at any position after the first character of the string. This character may only be present if 'z' is the first character of the string. If present, it indicates the presence of two arguments in the Augmentation Data of the CIE. The first argument is 1-byte and represents the pointer encoding used for the second argument, which is the address of a *personality routine* handler. The personality routine is used to handle language and vendor-specific tasks. The system unwind library interface accesses the language-specific exception handling semantics via the pointer to the personality routine. The personality routine does not have an ABI-specific name. The size of the personality routine pointer is specified by the pointer encoding used.

'R'

A 'R' may be present at any position after the first character of the string. This character may only be present if 'z' is the first character of the string. If present, The Augmentation Data shall include a 1 byte argument that represents the pointer encoding for the address pointers used in the FDE.

### 10.6.1.2 The Frame Description Entry Format

**Table 10-10 Frame Description Entry Format** 

Length	Required
Extended Length	Optional
FDE Pointer	Required
PC Begin	Required
PC Range	Required
Augmentation Data Length	Optional
Augmentation Data	Optional
Call Frame Instructions	Required
Padding	

### Length

A 4 byte unsigned value indicating the length in bytes of the FDE structure, not including the *Length* field itself. If *Length* contains the value 0xffffffff, then the length is contained the *Extended Length* field. If *Length* contains the value 0, then this FDE shall be considered a terminator and processing shall end.

### Extended Length

A 8 byte unsigned value indicating the length in bytes of the FDE structure, not including the *Length* or *Extended Length* field themselves. This field is not present unless the *Length* field contains the value 0xffffffff.

#### CIE Pointer

A 4 byte unsigned value that when subtracted from the offset of the CIE Pointer in the current FDE yields the offset of the start of the associated CIE. This value shall never be 0.

### PC Begin

An encoded value that indicates the address of the initial location associated with this FDE. The encoding format is specified in the Augmentation Data.

#### PC Range

An absolute value that indicates the number of bytes of instructions associated with this FDE.

### Augmentation Length

An unsigned LEB128 encoded value indicating the length in bytes of the Augmentation Data. This field is only present if the Augmentation String in the associated CIE contains the character 'z'.

#### Augmentation Data

A block of data whose contents are defined by the contents of the Augmentation String in the associated CIE as described above. This field is only present if the Augmentation String in the associated CIE contains the character 'z'. The size of this data is given by the Augentation Length.

#### Call Frame Instructions

A set of Call Frame Instructions.

#### Padding

Extra bytes to align the FDE structure to an addressing unit size boundary.

## 10.6.2 The .eh\_frame\_hdr section

The .eh\_frame\_hdr section contains additional information about the .eh\_frame section. A pointer to the start of the .eh\_frame data, and optionally, a binary search table of pointers to the .eh\_frame records are found in this section.

Data in this section is encoded according to Section 10.5.1.

Table 10-11 .eh\_frame\_hdr Section Format

Encoding	Field
unsigned byte	version
unsigned byte	eh_frame_ptr_enc
unsigned byte	fde_count_enc
unsigned byte	table_enc
encoded	eh_frame_ptr
encoded	fde_count
	binary search table

### version

Version of the .eh\_frame\_hdr format. This value shall be 1.

### eh\_frame\_ptr\_enc

The encoding format of the eh\_frame\_ptr field.

#### fde\_count\_enc

The encoding format of the fde\_count field. A value of DW\_EH\_PE\_omit indicates the binary search table is not present.

table\_enc

The encoding format of the entries in the binary search table. A value of DW\_EH\_PE\_omit indicates the binary search table is not present.

eh\_frame\_ptr

The encoded value of the pointer to the start of the .eh\_frame section.

fde count

The encoded value of the count of entries in the binary search table.

binary search table

A binary search table containing fde\_count entries. Each entry of the table consist of two encoded values, the initial location, and the address. The entries are sorted in an increasing order by the initial location value.

## 10.7 Symbol Versioning

### 10.7.1 Introduction

This chapter describes the Symbol Versioning mechanism. All ELF objects may provide or depend on versioned symbols. Symbol Versioning is implemented by 3 section types: SHT\_GNU\_versym, SHT\_GNU\_verdef, and SHT\_GNU\_verneed.

The prefix Elfxx in the following descriptions and code fragments stands for either "Elf32" or "Elf64", depending on the architecture.

Versions are described by strings. The structures that are used for symbol versions also contain a member that holds the ELF hashing values of the strings. This allows for more efficient processing.

## 10.7.2 Symbol Version Table

The special section .gnu.version which has a section type of SHT\_GNU\_versym shall contain the Symbol Version Table. This section shall have the same number of entries as the Dynamic Symbol Table in the .dynsym section.

The .gnu.version section shall contain an array of elements of type Elfxx\_Half. Each entry specifies the version defined for or required by the corresponding symbol in the Dynamic Symbol Table.

The values in the Symbol Version Table are specific to the object in which they are located. These values are identifiers that are provided by the the *vna\_other* member of the Elfxx\_Vernaux structure or the *vd\_ndx* member of the Elfxx\_Verdef structure.

The values 0 and 1 are reserved.

0

The symbol is local, not available outside the object.

1

The symbol is defined in this object and is globally available.

All other values are used to identify version strings located in one of the other Symbol Version sections. The value itself is not the version associated with the symbol. The string identified by the value defines the version of the symbol.

### 10.7.3 Version Definitions

The special section .gnu.version\_d which has a section type of SHT\_GNU\_verdef shall contain symbol version definitions. The number of entries in this section shall be

contained in the DT\_VERDEFNUM entry of the Dynamic Section .dynamic. The sh\_link member of the section header (see figure 4-8 in the <u>System V ABI</u>) shall point to the section that contains the strings referenced by this section.

The section shall contain an array of Elfxx\_Verdef structures, as described in <u>Figure 10-1</u>, optionally followed by an array of Elfxx\_Verdaux structures, as defined in <u>Figure 10-2</u>.

```
typedef struct {
        Elfxx_Half
                      vd_version;
        Elfxx_Half
                      vd_flags;
        Elfxx_Half
                      vd_ndx;
        Elfxx_Half
                      vd_cnt;
        Elfxx_Word
                      vd_hash;
        Elfxx_Word
                      vd_aux;
        Elfxx_Word
                      vd_next;
} Elfxx_Verdef;
```

### **Figure 10-1 Version Definition Entries**

```
vd_version
```

Version revision. This field shall be set to 1.

vd\_flags

Version information flag bitmask.

vd\_ndx

Version index numeric value referencing the SHT\_GNU\_versym section.

vd\_cnt

Number of associated verdaux array entries.

vd\_hash

Version name hash value (ELF hash function).

vd\_aux

Offset in bytes to a corresponding entry in an array of Elfxx\_Verdaux structures as defined in Figure 10-2

vd\_next

Offset to the next verdef entry, in bytes.

```
typedef struct {
    Elfxx_Word vda_name;
    Elfxx_Word vda_next;
} Elfxx_Verdaux;
```

Figure 10-2 Version Definition Auxiliary Entries

vda\_name

Offset to the version or dependency name string in the section header, in bytes.

vda\_next

Offset to the next verdaux entry, in bytes.

## 10.7.4 Version Requirements

The special section .gnu.version\_r which has a section type of SHT\_GNU\_verneed shall contain required symbol version definitions. The number of entries in this section

shall be contained in the DT\_VERNEEDNUM entry of the Dynamic Section .dynamic. The *sh\_link* member of the section header (see figure 4-8 in <u>System V ABI</u>) shall point to the section that contains the strings referenced by this section.

The section shall contain an array of Elfxx\_Verneed structures, as described in <u>Figure 10-3</u>, optionally followed by an array of Elfxx\_Vernaux structures, as defined in <u>Figure 10-4</u>.

```
typedef struct {
    Elfxx_Half vn_version;
    Elfxx_Half vn_cnt;
    Elfxx_Word vn_file;
    Elfxx_Word vn_aux;
    Elfxx_Word vn_next;
} Elfxx_Verneed;
```

### Figure 10-3 Version Needed Entries

```
vn_version
```

Version of structure. This value is currently set to 1, and will be reset if the versioning implementation is incompatibly altered.

vn\_cnt

Number of associated verneed array entries.

vn\_file

Offset to the file name string in the section header, in bytes.

vn\_aux

Offset to a corresponding entry in the vernaux array, in bytes.

vn\_next

Offset to the next verneed entry, in bytes.

```
typedef struct {
    Elfxx_Word vna_hash;
    Elfxx_Half vna_flags;
    Elfxx_Half vna_other;
    Elfxx_Word vna_name;
    Elfxx_Word vna_next;
} Elfxx_Vernaux;
```

### Figure 10-4 Version Needed Auxiliary Entries

```
vna_hash
```

Dependency name hash value (ELF hash function).

vna\_flags

Dependency information flag bitmask.

vna\_other

Object file version identifier used in the .gnu.version symbol version array. Bit number 15 controls whether or not the object is hidden; if this bit is set, the object cannot be used and the static linker will ignore the symbol's presence in the object.

vna\_name

Offset to the dependency name string in the section header, in bytes.

vna\_next

Offset to the next vernaux entry, in bytes.

## 10.7.5 Startup Sequence

When loading a sharable object the system shall analyze version definition data from the loaded object to assure that it meets the version requirements of the calling object. This step is referred to as definition testing. The dynamic loader shall retrieve the entries in the caller's Elfxx\_Verneed array and attempt to find matching definition information in the loaded Elfxx\_Verdef table.

Each object and dependency shall be tested in turn. If a symbol definition is missing and the vna\_flags bit for VER\_FLG\_WEAK is not set, the loader shall return an error and exit. If the vna\_flags bit for VER\_FLG\_WEAK is set in the Elfxx\_Vernaux entry, and the loader shall issue a warning and continue operation.

When the versions referenced by undefined symbols in the loaded object are found, version availability is certified. The test completes without error and the object shall be made available.

## 10.7.6 Symbol Resolution

When symbol versioning is used in an object, relocations extend definition testing beyond the simple match of symbol name strings: the version of the reference shall also equal the name of the definition.

The same index that is used in the symbol table can be referenced in the SHT\_GNU\_ver-sym section, and the value of this index is then used to acquire name data. The corresponding requirement string is retrieved from the Elfxx\_Verneed array, and likewise, the corresponding definition string from the Elfxx\_Verdef table.

If the high order bit (bit number 15) of the version symbolis set, the object cannot be used and the static linker shall ignore the symbol's presence in the object.

When an object with a reference and an object with the definition are being linked, the following rules shall govern the result:

- The object with the reference and the object with the definitions both use versioning. All described matching is processed in this case. A fatal error shall be triggered when no matching definition can be found in the object whose name is the one referenced by the *vn\_name* element in the Elfxx\_Verneed entry.
- The object with the reference does not use versioning, while the object with the definitions does. In this instance, only the definitions with index numbers 1 and 2 will be used in the reference match, the same identified by the static linker as the base definition. In cases where the static linker was not used, such as in calls to dlopen(), a version that does not have the base definition index shall be acceptable if it is the only version for which the symbol is defined.
- The object with the reference uses versioning, but the object with the definitions specifies none. A matching symbol shall be accepted in this case. A fatal error shall be triggered if a corruption in the required symbols list obscures an outdated object file and causes a match on the object filename in the Elfxx\_Verneed entry.
- Neither the object with the reference nor the object with the definitions use versioning. The behavior in this instance shall default to pre-existing symbol rules.

## 10.8 ABI note tag

Every executable shall contain a section named .note.ABI-tag of type SHT\_NOTE. This section is structured as a note section as documented in the ELF spec. The section shall contain at least the following entry. The name field (namesz/name) contains the string "GNU". The type field shall be 1. The descsz field shall be at least 16, and the

first 16 bytes of the desc field shall be as follows.

The first 32-bit word of the desc field shall be 0 (this signifies a Linux executable). The second, third, and fourth 32-bit words of the desc field contain the earliest compatible kernel version. For example, if the 3 words are 2, 2, and 5, this signifies a 2.2.5 kernel.

## 11 Dynamic Linking

## 11.1 Program Loading and Dynamic Linking

LSB-conforming implementations shall support the object file information and system actions that create running programs as specified in the <u>System V ABI</u> and <u>System V ABI Update</u> and as further required by this specification and the relevant architecture specific part of the LSB Core Specification.

Any shared object that is loaded shall contain sufficient DT\_NEEDED records to satisfy the symbols on the shared library.

## 11.2 Program Header

In addition to the Segment Types defined in the <u>System V ABI</u> and <u>System V ABI</u> <u>Update</u> the following Segment Types shall also be supported.

**Table 11-1 Linux Segment Types** 

14810 11 1 2 man segment 1 jpes		
Name	Value	
PT_GNU_EH_FRAME	0x6474e550	
PT_GNU_STACK	0x6474e551	
PT_GNU_RELRO	0x6474e552	

### PT\_GNU\_EH\_FRAME

The array element specifies the location and size of the exception handling information as defined by the .eh\_frame\_hdr section.

### PT\_GNU\_STACK

The  $p\_flags$  member specifies the permissions on the segment containing the stack and is used to indicate wether the stack should be executable. The absense of this header indicates that the stack will be executable.

### PT\_GNU\_RELRO

the array element specifies the location and size of a segment which may be made read-only after relocations have been processed.

## 11.3 Dynamic Entries

### 11.3.1 Introduction

As described in <u>System V ABI</u>, if an object file participates in dynamic linking, its program header table shall have an element of type PT\_DYNAMIC. This `segment' contains the .dynamic section. A special symbol, \_DYNAMIC, labels the section, which contains an array of the following structures.

```
typedef struct {
    Elf32_Sword d_tag;
    union {
        Elf32_Word d_val;
        Elf32_Addr d_ptr;
    } d_un;
} Elf32_Dyn;
extern Elf32_Dyn __DYNAMIC[];
typedef struct {
    Elf64_Sxword d_tag;
```

### Figure 11-1 Dynamic Structure

For each object with this type,  $d_tag$  controls the interpretation of  $d_un$ .

## 11.3.2 Dynamic Entries

## 11.3.2.1 ELF Dynamic Entries

The following dynamic entries are defined in the <u>System V ABI</u> and <u>System V ABI</u> <u>Update</u>.

DT\_BIND\_NOW

Process relocations of object

DT\_DEBUG

For debugging; unspecified

DT\_FINI

Address of termination function

DT\_FINI\_ARRAY

The address of an array of pointers to termination functions.

DT FINI ARRAYSZ

Size in bytes of DT\_FINI\_ARRAY

DT\_FLAGS

Flag values specific to the object being loaded

DT\_HASH

Address of symbol hash table

DT\_HIPROC

End of processor-specific

DT\_INIT

Address of init function

DT\_INIT\_ARRAY

The address of an array of pointers to initialization functions.

DT\_INIT\_ARRAYSZ

Size in bytes of DT\_INIT\_ARRAY

DT\_JMPREL

Address of PLT relocs

DT\_LOPROC

Start of processor-specific

DT\_NEEDED

Name of needed library

DT\_NULL

Marks end of dynamic section

DT\_PLTREL

Type of reloc in PLT

DT\_PLTRELSZ

Size in bytes of PLT relocs

DT\_PREINIT\_ARRAY

Array with addresses of preinit functions

DT\_PREINIT\_ARRAYSZ

Size in bytes of DT\_PREINIT\_ARRAY

DT\_REL

Address of Rel relocs

DT\_RELA

Address of Rela relocs

DT RELAENT

Size of one Rela reloc

DT\_RELASZ

Total size of Rela relocs

DT\_RELENT

Size of one Rel reloc

DT\_RELSZ

Total size of Rel relocs

DT\_RPATH

Library search path

DT\_RUNPATH

null-terminated library search path string

DT\_SONAME

Name of shared object

DT\_STRSZ

Size of string table

DT\_STRTAB

Address of string table

### DT\_SYMBOLIC

Start symbol search here

#### DT\_SYMENT

Size of one symbol table entry

### DT\_SYMTAB

Address of symbol table

### DT\_TEXTREL

Reloc might modify .text

## 11.3.2.2 Additional Dynamic Entries

An LSB conforming object may also use the following additional Dynamic Entry types.

### DT\_ADDRRNGHI

Values from DT\_ADDRRNGLO through DT\_ADDRRNGHI are reserved for definition by an architecture specific part.

#### DT ADDRRNGLO

Values from DT\_ADDRRNGLO through DT\_ADDRRNGHI are reserved for definition by an architecture specific part.

### DT\_AUXILIARY

Shared object to load before self

#### DT FILTER

Shared object to get values from

### DT\_HIOS

Values from DT\_LOOS through DT\_HIOS are reserved for definition by specific operating systems.

### DT\_LOOS

Values from DT\_LOOS through DT\_HIOS are reserved for definition by specific operating systems.

### DT\_NUM

Number of dynamic entry tags defined (excepting reserved ranges).

### DT POSFLAG 1

Flags for DT\_\* entries, effecting the following DT\_\* entry

### DT\_RELCOUNT

All Elf32\_Rel R\_\*\_RELATIVE relocations have been placed into a single block and this entry specifies the number of entries in that block. This permits ld.so.1 to streamline the processing of RELATIVE relocations.

### DT\_SYMINENT

Entry size of syminfo

### DT\_SYMINFO

Address of the Syminfo table.

## DT\_SYMINSZ

Size of syminfo table (in bytes)

### DT\_VALRNGHI

Entries which fall between DT\_VALRNGHI & DT\_VALRNGLO use the Dyn.d\_un.d\_val field of the Elf\*\_Dyn structure.

### DT\_VALRNGLO

Entries which fall between DT\_VALRNGHI & DT\_VALRNGLO use the Dyn.d\_un.d\_val field of the Elf\*\_Dyn structure.

### DT\_VERDEF

Address of version definition table

### DT\_VERDEFNUM

Number of version definitions

### DT\_VERNEED

Address of table with needed versions

### DT\_VERNEEDNUM

Number of needed versions

### DT\_VERSYM

Address of the table provided by the .gnu.version section.

## 12 C++ Class Representations

## 12.1 C++ Data Representation

Support for the C++ language shall be as specified in <u>Itanium<sup>TM</sup> C++ ABI</u>.

**Note:** This document, although containing a few architecture specific matters, is written as a generic specification, to be usable by C++ implementations on a variety of architectures.

This section provides additional information to supplement <u>Itanium<sup>TM</sup> C++ ABI</u>. Many of the definitions in that document are made in terms of C++. This section provides addition explanations using C terms to avoid self-referential problems.

## 12.1.1 Class Representation

An object file generated by the compilation process for a C++ program shall contain several closely related internal objects, or Class Components, to represent each C++ Class. Such objects are not a visible part of the source code. <u>Table 12-1</u> describes these Class Components at a high level.

**Table 12-1 Class Components** 

Object	Contains	
Class Data	All non-static Class members	
Virtual Table	Information needed to dispatch virtual functions, access virtual base class subobjects and to access the RTTI information	
RTTI	Run-Time Type Information used by the typeid and dynamic_cast operators, and exception handlers	
Typeinfo Name	String representation of Class name	
Construction Virtual Table	Information needed during construction and destruction of Classes with non-trivial inheritance relationships.	
VTT	A table of virtual table pointers which holds the addresses of construction and non-construction virtual tables.	

### 12.1.1.1 Virtual Table

fptr

Virtual tables are specified in Section 2.5.3 of <u>Itanium<sup>™</sup> C++ ABI</u>.

Of the various categories of virtual table described in that specification, Category 1 (Leaf) is further described in <u>Figure 12-1</u> and Category 2 (Non-virtual bases only) is further described in <u>Figure 12-2</u>. LSB conforming systems shall support these categories.

```
struct {
                         baseobject;
        ptrdiff_t
                          *typeinfo;
        const char
        fptr
                          virtfuncs[0];
};
Figure 12-1 Category 1 Virtual Table
struct {
        unsigned long
                         vcalloffset;
        ptrdiff_t
                         baseobject;
        const char
                          *typeinfo;
```

virtfuncs[0];

**}**;

### Figure 12-2 Category 2 Virtual Table

This specification describes requirements for virtual tables of C++ classes using tables of the following form:

Table 12-2 Primary vtable for K (example)

table 12-2 i i initially vitable for ix (example)			
Base Offset	0		
Virtual Base Offset	0		
RTTI	typeinfo for K		
vfunc[0]:	K::~K()		
vfunc[1]:	K::~K()		
vfunc[2]:	K::m1(int*)		
vfunc[3]:	X::m2()		
vfunc[4]:	cxa_pure_virtual()		
vfunc[5]:	NULL or X::m4(int)		

Each row starting from 'vfunc[i]:' refers to a vtable entry 'vfunc[i]' of a class K, which is an entry for a virtual function A::m, where A is a base class of the class K as described in the <u>Itanium<sup>TM</sup> C++ ABI</u>. This specification requires implementations to interpret the vtable entry information in the following way:

- A conforming implementation shall contain a vtable of the class K in the specified shared library;
- The corresponding entry of this vtable 'vfunc[i]' shall be an entry for the virtual function A::m;
- 3. If the second column of the row contains \_\_cxa\_pure\_virtual() the corresponding vtable entry of a LSB-conforming implementation shall contain \_\_cxa\_pure\_virtual() or 'Y::m', where Y is the class K, the class A or a base class of the class K derived from the class A.

**Note:** In this case virtual function A::m in class K is considered to be specified as pure virtual by this specification.

- 4. If the second column of the row contains 'X::m' the corresponding vtable entry of a LSB-conforming implementation shall contain 'Y::m', where Y is the class K, the class X or a base class of the class K derived from the class X.
- 5. If the second column of the row contains 'NULL or X::m' the corresponding vtable entry of a LSB-conforming implementation shall contain NULL or 'Y::m', where Y is the class K, the class X or a base class of the class K derived from the class X.

**Note:** In this case virtual function A::m in class K is considered to be specified as inline by this specification.

An application may use any non-pure virtual function specified in this specification, and can expect the specified behavior irrespective of which particular method implements this functionality. An application may not use inline virtual functions at the binary level since its vtable entry may be NULL.

### 12.1.1.2 Run-Time Type Information

Each type used in a C++ program has a data structure associated with it that provide information about the type which is used at runtime. This Run Time Type Information (RTTI) is defined in section 2.9.5 in <a href="Itanium">Itanium</a>TM C++ ABI. Additional details about the layout of this data is provided here.

```
struct {
        void
                  *basevtable;
       char
                   *name;
};
Figure 12-3 Run-Time Type Information Prefix
struct {
        void
                   *basevtable;
                   *name;
       char
       void
                   *basetypeinfo[0];
};

};

# 13 Symbol Mapping

This chapter defines how names are mapped from the source symbol to the object symbol.

## 13.1 Symbol Mapping

Symbols in a source program are translated by the compilation system into symbols that exist in the object file. The rules for this translation are defined here.

## 13.1.1 C++ Language

External symbol names in a C++ object file shall be encoded according to the "name mangling" rules described in the <u>Itanium<sup>TM</sup> C++ ABI</u>.

# **III Base Libraries**

### 14 Base Libraries

### 14.1 Introduction

An LSB-conforming implementation shall support the following base libraries which provide interfaces for accessing the operating system, processor and other hardware in the system.

- · libc
- libm
- · libgcc\_s
- · libdl
- librt
- libcrypt
- · libpam

There are three main parts to the definition of each of these libraries.

The "Interfaces" section defines the required library name and version, and the required public symbols (interfaces and global data), as well as symbol versions, if any.

The "Interface Definitions" section provides complete or partial definitions of certain interfaces where either this specification is the source specification, or where there are variations from the source specification. If an interface definition requires one or more header files, one of those headers shall include the function prototype for the interface.

For source definitions of interfaces which include a reference to a header file, the contents of such header files form a part of the specification. The "Data Definitions" section provides the binary-level details for the header files from the source specifications, such as values for macros and enumerated types, as well as structure layouts, sizes and padding, etc. These data definitions, although presented in the form of header files for convenience, should not be taken a representing complete header files, as they are a supplement to the source specifications. Application developers should follow the guidelines of the source specifications when determining which header files need to be included to completely resolve all references.

**Note:** While the Data Definitions supplement the source specifications, this specification itself does not require conforming implementations to supply any header files.

## 14.2 Program Interpreter

The Program Interpreter is specified in the appropriate architecture specific part of the LSB Core Specification.

### 14.3 Interfaces for libc

<u>Table 14-1</u> defines the library name and shared object name for the libc library

#### **Table 14-1 libc Definition**

Library:	libc
SONAME:	See architecture specific part.

The behavior of the interfaces in this library is specified by the following specifications:

[LFS] Large File Support

[LSB] This Specification

[RPC + XDR] <u>RFC 5531/4506 RPC & XDR</u>

[SUSv2] SUSv2

[SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)

[SUSv4] <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> [SVID.4] <u>SVID Issue 4</u>

## 14.3.1 RPC

## 14.3.1.1 Interfaces for RPC

An LSB conforming implementation shall provide the generic functions for RPC specified in <u>Table 14-2</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-2 libc - RPC Function Interfaces** 

authnone_create [SVID.4]	callrpc [RPC + XDR]	clnt_create [SVID.4]	clnt_pcreateerror [SVID.4]
clnt_perrno [SVID.4]	clnt_perror [SVID.4]	clnt_spcreateerror [SVID.4]	clnt_sperrno [SVID.4]
clnt_sperror [SVID.4]	clntraw_create [RPC + XDR]	clnttcp_create [RPC + XDR]	clntudp_bufcreate [RPC + XDR]
clntudp_create [RPC + XDR]	key_decryptsessio n [SVID.4]	pmap_getport [LSB]	pmap_set [LSB]
pmap_unset [LSB]	svc_getreqset [SVID.4]	svc_register [LSB]	svc_run [LSB]
svc_sendreply [LSB]	svcerr_auth [SVID.4]	svcerr_decode [SVID.4]	svcerr_noproc [SVID.4]
svcerr_noprog [SVID.4]	svcerr_progvers [SVID.4]	svcerr_systemerr [SVID.4]	svcerr_weakauth [SVID.4]
svcfd_create [RPC + XDR]	svcraw_create [RPC + XDR]	svctcp_create [LSB]	svcudp_create [LSB]
xdr_accepted_repl y [SVID.4]	xdr_array [SVID.4]	xdr_bool [SVID.4]	xdr_bytes [SVID.4]
xdr_callhdr [SVID.4]	xdr_callmsg [SVID.4]	xdr_char [SVID.4]	xdr_double [SVID.4]
xdr_enum [SVID.4]	xdr_float [SVID.4]	xdr_free [SVID.4]	xdr_int [SVID.4]
xdr_long [SVID.4]	xdr_opaque [SVID.4]	xdr_opaque_auth [SVID.4]	xdr_pointer [SVID.4]
xdr_reference [SVID.4]	xdr_rejected_reply [SVID.4]	xdr_replymsg [SVID.4]	xdr_short [SVID.4]
xdr_string [SVID.4]	xdr_u_char [SVID.4]	xdr_u_int [LSB]	xdr_u_long [SVID.4]
xdr_u_short [SVID.4]	xdr_union [SVID.4]	xdr_vector [SVID.4]	xdr_void [SVID.4]
xdr_wrapstring [SVID.4]	xdrmem_create [SVID.4]	xdrrec_create [SVID.4]	xdrrec_endofrecor d [ <u>RPC + XDR</u> ]
xdrrec_eof [SVID.4]	xdrrec_skiprecord [RPC + XDR]	xdrstdio_create [LSB]	

An LSB conforming implementation shall provide the generic deprecated functions for RPC specified in <u>Table 14-3</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Note:** These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.

**Table 14-3 libc - RPC Deprecated Function Interfaces** 

key_decryptsessio		
n [SVID.4]		

## 14.3.2 Epoll

## 14.3.2.1 Interfaces for Epoll

An LSB conforming implementation shall provide the generic functions for Epoll specified in <u>Table 14-4</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-4 libc - Epoll Function Interfaces** 

epoll_create(GLIB	epoll_ctl(GLIBC_	epoll_wait(GLIBC	
C_2.3.2) [LSB]	2.3.2) [LSB]	_2.3.2) [LSB]	

## 14.3.3 System Calls

## 14.3.3.1 Interfaces for System Calls

An LSB conforming implementation shall provide the generic functions for System Calls specified in <u>Table 14-5</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-5 libc - System Calls Function Interfaces**

## 14.3.22 GNU Extensions for libc

### 14.3.22.1 Interfaces for GNU Extensions for libc

An LSB conforming implementation shall provide the generic functions for GNU Extensions for libc specified in <u>Table 14-37</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-37 libc - GNU Extensions for libc Function Interfaces

gnu_get_libc_rele gnu_get_libc_vers
ase [LSB] ion [LSB]

### 14.4 Data Definitions for libc

This section defines global identifiers and their values that are associated with interfaces contained in libc. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

## 14.4.1 argz.h

```
typedef int error_t;
extern error_t argz_add(char **argz, size_t * argz_len, const
char *str);
extern error_t argz_add_sep(char **argz, size_t * argz_len,
                              const char *str, int sep);
extern error_t argz_append(char **argz, size_t * argz_len, const
char *buf,
                            size_t buf_len);
extern size_t argz_count(const char *argz, size_t * argz_len);
extern error_t argz_create(char *const argv[], char **argz,
                            size_t * argz_len);
extern error_t argz_create_sep(const char *str, int sep, char
**argz,
                                size_t * argz_len);
 **argz, size_t * argz_len,
extern void argz_delete(char
                                                                 char
*entrv);
extern void argz_extract(const char *argz, size_t argz_len, char
**argv);
extern error_t argz_insert(char **argz_insert, size_t * argz_len,
                            char *before, const char *entry);
extern char argz_next(const char *argz, size_t argz_len,
                       const char *entry);
extern error_t argz_replace(char **argz, size_t * argz_len, const char *str, const char *with,
                              unsigned int *replace_count);
extern void argz_stringify(char *argz, size_t argz_len, int sep);
```

```

#### 14.5 Interface Definitions for libc

The interfaces defined on the following pages are included in libc and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 14.3</u> shall behave as described in the referenced base document.

#### \_IO\_feof

#### **Name**

\_IO\_feof — alias for feof

## **Synopsis**

```
int _IO_feof(_IO_FILE * __fp);
```

# **Description**

\_IO\_feof() tests the end-of-file indicator for the stream pointed to by \_\_fp, returning a non-zero value if it is set.

\_IO\_feof() is not in the source standard; it is only in the binary standard.

## \_IO\_getc

#### Name

\_IO\_getc — alias for getc

# **Synopsis**

```
int _IO_getc(_IO_FILE * __fp);
```

# **Description**

\_IO\_getc() reads the next character from \_\_fp and returns it as an unsigned char cast to an int, or EOF on end-of-file or error.

\_IO\_getc() is not in the source standard; it is only in the binary standard.

# \_IO\_putc

#### **Name**

```
_IO_putc — alias for putc
```

# **Synopsis**

```
int _IO_putc(int __c, _IO_FILE * __fp);
```

# **Description**

\_IO\_putc() writes the character \_\_c, cast to an unsigned char, to \_\_fp.

\_IO\_putc() is not in the source standard; it is only in the binary standard.

### \_IO\_puts

#### **Name**

\_IO\_puts — alias for puts

## **Synopsis**

int \_IO\_puts(const char \* \_\_c);

## **Description**

\_IO\_puts() writes the string \_\_s and a trailing newline to stdout.

\_IO\_puts() is not in the source standard; it is only in the binary standard.

#### \_\_assert\_fail

#### **Name**

\_\_assert\_fail — abort the program after false assertion

## **Synopsis**

void \_\_assert\_fail(const char \* assertion, const char \* file, unsigned
int line, const char \* function);

## **Description**

The \_\_assert\_fail() function is used to implement the assert() interface of POSIX 1003.1-2008 (ISO/IEC 9945-2009). The \_\_assert\_fail() function shall print the given file filename, line line number, function function name and a message on the standard error stream in an unspecified format, and abort program execution via the abort() function. For example:

```
a.c:10: foobar: Assertion a == b failed.
```

If function is NULL, \_\_assert\_fail() shall omit information about the function.

assertion, file, and line shall be non-NULL.

The \_\_assert\_fail() function is not in the source standard; it is only in the binary standard. The assert() interface is not in the binary standard; it is only in the source standard. The assert() may be implemented as a macro.

#### \_\_chk\_fail

#### **Name**

\_\_chk\_fail — terminate a function in case of buffer overflow

## **Synopsis**

void \_\_chk\_fail(void);

## **Description**

The interface \_\_chk\_fail() shall abort the function that called it with a message that a buffer overflow has been detected. The program that called the function shall then exit.

The \_\_chk\_fail() function is not in the source standard; it is only in the binary standard.

# **Application Usage (informative)**

The interface \_\_chk\_fail() does not check for a buffer overflow itself. It merely reports one when invoked.

#### \_\_confstr\_chk

#### **Name**

\_\_confstr\_chk — get configuration dependent string variables, with buffer overflow checking

# **Synopsis**

```
#include <unistd.h>
size_t __confstr_chk(int name, char * buf, size_t len, size_t
buflen);
```

# **Description**

The interface \_\_confstr\_chk() shall function in the same way as the interface conf-str(), except that \_\_confstr\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_confstr\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_ctype\_b\_loc

#### **Name**

\_\_ctype\_b\_loc — accessor function for \_\_ctype\_b array for ctype functions

# **Synopsis**

```
#include <ctype.h>
const unsigned short * * __ctype_b_loc (void);
```

## **Description**

The \_\_ctype\_b\_loc() function shall return a pointer into an array of characters in the current locale that contains characteristics for each character in the current character set. The array shall contain a total of 384 characters, and can be indexed with any signed or unsigned char (i.e. with an index value between -128 and 255). If the application is multithreaded, the array shall be local to the current thread.

This interface is not in the source standard; it is only in the binary standard.

#### **Return Value**

The \_\_ctype\_b\_loc() function shall return a pointer to the array of characters to be used for the ctype() family of functions (see <ctype.h>).

#### \_\_ctype\_get\_mb\_cur\_max

#### Name

\_\_ctype\_get\_mb\_cur\_max — maximum length of a multibyte character in the current locale

# **Synopsis**

```
size_t __ctype_get_mb_cur_max(void);
```

# **Description**

\_\_ctype\_get\_mb\_cur\_max() returns the maximum length of a multibyte character in the current locale.

\_\_ctype\_get\_mb\_cur\_max() is not in the source standard; it is only in the binary standard.

#### \_\_ctype\_tolower\_loc

#### **Name**

\_\_ctype\_tolower\_loc — accessor function for \_\_ctype\_b\_tolower array for ctype tolower() function

## **Synopsis**

```
#include <ctype.h>
int32_t * * __ctype_tolower_loc(void);
```

# **Description**

The \_\_ctype\_tolower\_loc() function shall return a pointer into an array of characters in the current locale that contains lower case equivalents for each character in the current character set. The array shall contain a total of 384 characters, and can be indexed with any signed or unsigned char (i.e. with an index value between -128 and 255). If the application is multithreaded, the array shall be local to the current thread.

This interface is not in the source standard; it is only in the binary standard.

#### **Return Value**

The \_\_ctype\_tolower\_loc() function shall return a pointer to the array of characters to be used for the ctype() family of functions (see <ctype.h>).

#### \_\_ctype\_toupper\_loc

#### Name

\_\_ctype\_toupper\_loc — accessor function for \_\_ctype\_b\_toupper() array for ctype toupper() function

# **Synopsis**

```
#include <ctype.h>
int32_t * * __ctype_toupper_loc(void);
```

# **Description**

The \_\_ctype\_toupper\_loc() function shall return a pointer into an array of characters in the current locale that contains upper case equivalents for each character in the current character set. The array shall contain a total of 384 characters, and can be indexed with any signed or unsigned char (i.e. with an index value between -128 and 255). If the application is multithreaded, the array shall be local to the current thread.

This interface is not in the source standard; it is only in the binary standard.

#### **Return Value**

The \_\_ctype\_toupper\_loc() function shall return a pointer to the array of characters to be used for the ctype() family of functions (see <ctype.h>).

#### cxa\_atexit

#### **Name**

\_\_cxa\_atexit — register a function to be called by exit or when a shared library is unloaded

# **Synopsis**

int \_\_cxa\_atexit(void (\*func) (void \*), void \* arg, void \*
dso\_handle);

# **Description**

As described in the <a href="Itanium">Itanium</a> C++ ABI, \_\_cxa\_atexit() registers a destructor function to be called by exit() or when a shared library is unloaded. When a shared library is unloaded, any destructor function associated with that shared library, identified by <code>dso\_handle</code>, shall be called with the single argument <code>arg</code>, and then that function shall be removed, or marked as complete, from the list of functions to run at exit(). On a call to exit(), any remaining functions registered shall be called with the single argument <code>arg</code>. Destructor functions shall always be called in the reverse order to their registration (i.e. the most recently registered function shall be called first),

The \_\_cxa\_atexit() function is used to implement atexit(), as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009). Calling atexit(func) from the statically linked part of an application shall be equivalent to \_\_cxa\_atexit(func, NULL, NULL).

\_\_cxa\_atexit() is not in the source standard; it is only in the binary standard.

Note: atexit() is not in the binary standard; it is only in the source standard.

#### cxa\_finalize

#### **Name**

\_\_cxa\_finalize — call destructors of global (or local static) C++ objects and exit functions registered with atexit

## **Synopsis**

```
void __cxa_finalize(void * d);
```

## **Description**

As described in the Itanium® C++ ABI, the C runtime library shall maintain a list of termination function entries containing the following information:

- A pointer to a termination function.
- An operand to be passed to the function.
- A handle identifying the home shared library of the entry.

The list is populated by entries of two kinds:

- Destructors of global (or local static) C++ objects that require destruction on exit.
- Functions registered by the user with atexit().

In the former case an entry consists of a pointer to the destructor, a pointer to the corresponding object and a handle for the home shared library of the object. In the latter case the pointer to the function is the pointer passed to atexit(), while the other pointers are NULL.

When \_\_cxa\_finalize(d) is called, it shall walk the termination function list, calling each in turn if d matches the handle of the termination function entry. If d is NULL, it shall call all the termination functions. Multiple calls to \_\_cxa\_finalize shall not result in calling termination function entries multiple times; the implementation may either remove entries or mark them finished. The termination functions shall always be called in the reverse order of their registration (i.e. the most recently registered function shall be called first).

An application shall not call \_\_cxa\_finalize() directly. The implementation shall arrange for \_\_cxa\_finalize() to be called during early shared library unload (e.g. dlclose()) with a handle to the shared library. When the main program calls exit, the implementation shall cause any remaining \_\_cxa\_atexit-registered functions to be called, either by calling \_\_cxa\_finalize(NULL), or by walking the registration list itself.

\_\_cxa\_finalize() is not in the source standard; it is only in the binary standard.

# \_\_daylight

#### Name

\_\_daylight — external daylight savings time flag

# **Synopsis**

int \_\_daylight;

# Description

The external variable \_\_daylight shall implement the daylight savings time flag daylight as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. \_\_daylight has the same specification as daylight.

#### environ

#### Name

\_\_environ — alias for environ - user environment

## **Synopsis**

extern char \*\*\_\_environ;

## **Description**

The external variable \_\_environ shall implement the environment variable environ as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. \_\_environ has the same specification as environ.

#### \_\_errno\_location

#### Name

\_\_errno\_location — address of errno variable

#### **Synopsis**

int \* \_\_errno\_location(void);

#### **Description**

The \_\_errno\_location() function shall return the address of the errno variable for the current thread.

\_\_errno\_location() is not in the source standard; it is only in the binary standard.

# \_\_fgets\_chk

#### **Name**

\_\_fgets\_chk — string input, with buffer overflow checking

# **Synopsis**

```
#include <stdio.h>
char * __fgets_chk(char * s, size_t size, int strsize, FILE *
stream);
```

# **Description**

The interface \_\_fgets\_chk() shall function in the same way as the interface fgets(), except that \_\_fgets\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The \_\_fgets\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_fgets\_unlocked\_chk

#### **Name**

\_\_fgets\_unlocked\_chk — non-locking string input, with buffer overflow checking

## **Synopsis**

```
#include <stdio.h>
char * __fgets_unlocked_chk(char * s, size_t size, int strsize, FILE
* stream);
```

## **Description**

The interface \_\_fgets\_unlocked\_chk() shall function in the same way as the interface fgets\_unlocked(), except that \_\_fgets\_unlocked\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The \_\_fgets\_unlocked\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_fgetws\_chk

#### **Name**

\_\_fgetws\_chk — read a wide-character string from a FILE stream, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __fgetws_chk(wchar_t * ws, size_t size, int strsize, FILE
* stream);
```

# **Description**

The interface \_\_fgetws\_chk() shall function in the same way as the interface fgetws(), except that \_\_fgetws\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The \_\_fgetws\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_fgetws\_unlocked\_chk

#### Name

\_\_fgetws\_unlocked\_chk — read a wide-character string from a FILE stream in a non-locking manner, with stack checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __fgetws_unlocked_chk(wchar_t * ws, size_t strsize, int n,
FILE * stream);
```

## **Description**

The interface \_\_fgetws\_unlocked\_chk() shall function in the same way as the interface fgetws\_unlocked(), except that \_\_fgetws\_unlocked\_chk() shall check for stack overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The \_\_fgetws\_unlocked\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_fpending

#### **Name**

\_\_fpending — returns in bytes the amount of output pending on a stream

## **Synopsis**

```
size_t __fpending(FILE * stream);
```

# **Description**

- \_\_fpending() returns the amount of output in bytes pending on a stream.
- \_\_fpending() is not in the source standard; it is only in the binary standard.

#### \_\_fprintf\_chk

#### **Name**

\_\_fprintf\_chk — convert formatted output, with stack checking

## **Synopsis**

```
#include <stdio.h>
int __fprintf_chk(FILE * stream, int flag, const char * format);
```

## **Description**

The interface \_\_fprintf\_chk() shall function in the same way as the interface fprintf(), except that \_\_fprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_fprintf\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_fwprintf\_chk

#### **Name**

\_\_fwprintf\_chk — convert formatted wide-character output, with stack checking

## **Synopsis**

```
#include <wchar.h>
int __fwprintf_chk(FILE * stream, int flag, const wchar_t * format);
```

# **Description**

The interface \_\_fwprintf\_chk() shall function in the same way as the interface fw-printf(), except that \_\_fwprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the flag parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_fwprintf\_chk() function is not in the source standard; it is only in the binary standard.

#### fxstatat

#### Name

\_\_fxstatat — get file status relative to directory file descriptor

# **Synopsis**

#include <fcntl.h>

#### LSB Core - Generic 5.0

#include <sys/stat.h>
int \_\_fxstatat(int ver, int dirfd, const char \* path, struct stat \*
stat\_buf, int flags);

#### **Description**

The \_\_fxstatat() function shall implement the fstatat() function. The behavior of \_\_fxstatat() for values of *ver* other than \_STAT\_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of \_STAT\_VER.

\_\_fxstatat(\_STAT\_VER, dirfd, stat\_buf, flags) shall behave as fstatat(dirfd, stat\_buf, flags) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

\_\_fxstatat() is not in the source standard; it is only in the binary standard.

**Note:** The fstatat() function is not in the binary standard; it is only in the source standard

#### \_\_fxstatat64, fstatat64

#### **Name**

\_\_fxstatat64, fstatat64 — get file status relative to a directory file descriptor (Large File Support)

## **Synopsis**

```
#include <fcntl.h>
#include <sys/stat.h>
int __fxstatat64(int ver, int dirfd, const char * path, struct
stat64 * stat_buf, int flags);
int fstatat64(int dirfd, const char * file, struct stat64 * buf, int
flag);
```

# Description

fstatat64() is a large-file version of the fstatat() function as defined in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009). It differs from fstatat() only in that the *buf* parameter refers to a large-file version of the stat structure.

The \_\_fxstatat64() function shall implement the fstatat64() function. The behavior of \_\_fxstatat64() for values of *ver* other than \_STAT\_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of \_STAT\_VER.

\_\_fxstatat64(\_STAT\_VER, dirfd,  $stat\_buf$ , flags) shall behave as fstatat64(dirfd,  $stat\_buf$ , flags)

\_\_fxstatat64() is not in the source standard; it is only in the binary standard.

**Note:** The fstatat64() function is not in the binary standard; it is only in the source standard.

#### \_\_getcwd\_chk

#### **Name**

\_\_getcwd\_chk — get current working directory, with buffer overflow checking

## **Synopsis**

```
#include <unistd.h>
char * __getcwd_chk(char * buf, size_t len, size_t buflen);
```

## **Description**

The interface \_\_getcwd\_chk() shall function in the same way as the interface getcwd(), except that \_\_getcwd\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_getcwd\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_getgroups\_chk

#### **Name**

\_\_getgroups\_chk — get list of supplementary group IDs, with buffer overflow checking

## **Synopsis**

```
#include <unistd.h>
int __getgroups_chk(int size, gid_t * list, size_t listlen);
```

# **Description**

The interface \_\_getgroups\_chk() shall function in the same way as the interface getgroups(), except that \_\_getgroups\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *listlen* specifies the size in bytes of the object *list*.

The \_\_getgroups\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_gethostname\_chk

#### **Name**

\_\_gethostname\_chk — get host name, with buffer overflow checking

## **Synopsis**

```
#include <unistd.h>
int __gethostname_chk(char * buf, size_t buflen, size_t maxlen);
```

## **Description**

The interface \_\_gethostname\_chk() shall function in the same way as the interface gethostname(), except that \_\_gethostname\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *buflen* exceeds *maxlen*, the function shall abort, and the program calling it shall exit.

The \_\_gethostname\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_getlogin\_r\_chk

#### **Name**

\_\_getlogin\_r\_chk — get user name, with buffer overflow checking (reentrant)

## **Synopsis**

```
#include <unistd.h>
int __getlogin_r_chk(char * buf, size_t buflen, size_t maxlen);
```

# **Description**

The interface \_\_getlogin\_r\_chk() shall function in the same way as the interface getlogin\_r(), except that \_\_getlogin\_r\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *buflen* exceeds *maxlen*, the function shall abort, and the program calling it shall exit.

The \_\_getlogin\_r\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_getpagesize

#### **Name**

\_\_getpagesize — alias for getpagesize - get current page size

# **Synopsis**

int \_\_getpagesize(void);

# **Description**

- \_\_getpagesize() is an alias for getpagesize() get current page size.
- \_\_getpagesize() has the same specification as getpagesize().
- \_\_getpagesize() is not in the source standard; it is only in the binary standard.

# \_\_getpgid

### **Name**

\_\_getpgid — get the process group id

## **Synopsis**

pid\_t \_\_getpgid(pid\_t pid);

# **Description**

- \_\_getpgid() has the same specification as getpgid().
- \_\_getpgid() is not in the source standard; it is only in the binary standard.

#### h\_errno\_location

#### **Name**

\_\_h\_errno\_location — address of h\_errno variable

# **Synopsis**

int \* \_\_h\_errno\_location(void);

# **Description**

\_\_h\_errno\_location() returns the address of the h\_errno variable, where h\_errno is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

\_\_h\_errno\_location() is not in the source standard; it is only in the binary standard. Note that h\_errno itself is only in the source standard; it is not in the binary standard.

#### isinf

#### **Name**

\_\_isinf — test for infinity

## **Synopsis**

int \_\_isinf(double arg);

## **Description**

\_\_isinf() has the same specification as isinf() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that the argument type for \_\_isinf() is known to be double.

\_\_isinf() is not in the source standard; it is only in the binary standard.

#### \_\_isinff

#### **Name**

\_\_isinff — test for infinity

## **Synopsis**

int \_\_isinff(float arg);

## **Description**

\_\_isinff() has the same specification as isinf() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> except that the argument type for \_\_isinff() is known to be float.

\_\_isinff() is not in the source standard; it is only in the binary standard.

#### isinfl

#### **Name**

\_\_isinfl — test for infinity

# **Synopsis**

int \_\_isinfl(long double arg);

# **Description**

\_\_isinf1() has the same specification as isinf() in the <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), except that the argument type for \_\_isinf1() is known to be long double.

\_\_isinfl() is not in the source standard; it is only in the binary standard.

#### isnan

#### **Name**

\_\_isnan — test for infinity

## **Synopsis**

int \_\_isnan(double arg);

## **Description**

\_\_isnan() has the same specification as isnan() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that the argument type for \_\_isnan() is known to be double.

\_\_isnan() is not in the source standard; it is only in the binary standard.

#### \_\_isnanf

#### **Name**

\_\_isnanf — test for infinity

## **Synopsis**

int \_\_isnanf(float arg);

# **Description**

 $\_$ isnanf() has the same specification as isnan() in  $\underline{POSIX\ 1003.1-2008\ (ISO/IEC\ 9945-2009)}$ , except that the argument type for  $\_$ isnanf() is known to be float.

\_\_isnanf() is not in the source standard; it is only in the binary standard.

#### isnanl

#### **Name**

\_\_isnanl — test for infinity

# **Synopsis**

int \_\_isnanl(long double arg);

# **Description**

\_\_isnan1() has the same specification as isnan() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that the argument type for \_\_isnan1() is known to be long double.

\_\_isnanl() is not in the source standard; it is only in the binary standard.

## \_\_libc\_current\_sigrtmax

#### Name

\_\_libc\_current\_sigrtmax — return number of available real-time signal with lowest priority

# **Synopsis**

int \_\_libc\_current\_sigrtmax(void);

## **Description**

 $\_$ libc\_current\_sigrtmax() returns the number of an available real-time signal with the lowest priority.

\_\_libc\_current\_sigrtmax() is not in the source standard; it is only in the binary standard.

### \_\_libc\_current\_sigrtmin

#### Name

\_\_libc\_current\_sigrtmin — return number of available real-time signal with highest priority

# **Synopsis**

int \_\_libc\_current\_sigrtmin(void);

## **Description**

\_\_libc\_current\_sigrtmin() returns the number of an available real-time signal with the highest priority.

\_\_libc\_current\_sigrtmin() is not in the source standard; it is only in the binary standard.

#### \_\_libc\_start\_main

#### **Name**

\_\_libc\_start\_main — initialization routine

## **Synopsis**

int \_\_libc\_start\_main(int (\*main) (int, char \*\*, char \*\*), int argc,
char \*\* ubp\_av, void (\*init) (void), void (\*fini) (void), void
(\*rtld\_fini) (void), void (\*stack\_end));

## **Description**

The \_\_libc\_start\_main() function shall perform any necessary initialization of the execution environment, call the *main* function with appropriate arguments, and handle the return from main(). If the main() function returns, the return value shall be passed to the exit() function.

**Note:** While this specification is intended to be implementation independent, process and library initialization may include:

- performing any necessary security checks if the effective user ID is not the same as the real user ID.
- · initialize the threading subsystem.
- registering the rtld\_fini to release resources when this dynamic shared object exits (or is unloaded).
- registering the fini handler to run at program exit.
- calling the initializer function (\*init)().
- calling main() with appropriate arguments.
- calling exit() with the return value from main().

This list is an example only.

\_\_libc\_start\_main() is not in the source standard; it is only in the binary standard.

#### See Also

The section on Process Initialization in each of the architecture specific parts of the LSB Core Specification.

#### \_\_mbsnrtowcs\_chk

#### **Name**

\_\_mbsnrtowcs\_chk — convert a multibyte string to a wide-character string, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
size_t __mbsnrtowcs_chk(wchar_t * dest, const char * * src, size_t
nmc, size_t len, mbstate_t * ps, size_t destlen);
```

#### **Description**

The interface \_\_mbsnrtowcs\_chk() shall function in the same way as the interface mbsnrtowcs(), except that \_\_mbsnrtowcs\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_mbsnrtowcs\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_mbsrtowcs\_chk

#### **Name**

\_\_mbsrtowcs\_chk — convert a multibyte string to a wide-character string, with buffer overflow checking

# **Synopsis**

```
#include <wchar.h>
size_t __mbsrtowcs_chk(wchar_t * dest, const char * * src, size_t
len, mbstate_t * ps, size_t destlen);
```

# **Description**

The interface \_\_mbsrtowcs\_chk() shall function in the same way as the interface mb-srtowcs(), except that \_\_mbsrtowcs\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_mbsrtowcs\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_mbstowcs\_chk

#### **Name**

\_\_mbstowcs\_chk — convert a multibyte string to a wide-character string, with buffer overflow checking

## **Synopsis**

```
#include <stdlib.h>
size_t __mbstowcs_chk(wchar_t * dest, const char * src, size_t len,
size_t destlen);
```

## **Description**

The interface \_\_mbstowcs\_chk() shall function in the same way as the interface mbstowcs(), except that \_\_mbstowcs\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_mbstowcs\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_memcpy\_chk

#### Name

\_\_memcpy\_chk — copy memory area, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
void * __memcpy_chk(void * dest, const void * src, size_t len,
size_t destlen);
```

# **Description**

The interface \_\_memcpy\_chk() shall function in the same way as the interface memcpy(), except that \_\_memcpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_memcpy\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_memmove\_chk

#### **Name**

\_\_memmove\_chk — copy memory area, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
void * __memmove_chk(void * dest, const void * src, size_t len,
size_t destlen);
```

## **Description**

The interface \_\_memmove\_chk() shall function in the same way as the interface memmove(), except that \_\_memmove\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_memmove\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_mempcpy

#### **Name**

\_\_mempcpy — copy given number of bytes of source to destination

## **Synopsis**

```
#include <string.h>
void * __mempcpy(void * restrict dest, const void * restrict src,
size_t n);
```

# **Description**

\_\_mempcpy() copies n bytes of src to dest, returning a pointer to the byte after the last written byte.

If copying takes place between objects that overlap, the behavior is undefined.

If either dest or src is a null pointer, the behavior is undefined.

If n is 0 and the other parameters are valid, the return value is dest.

\_\_mempcpy() is not in the source standard; it is only in the binary standard.

#### \_\_mempcpy\_chk

#### **Name**

\_\_mempcpy\_chk — copy memory area, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
void * __mempcpy_chk(void * dest, const void * src, size_t len,
size_t destlen);
```

## **Description**

The interface \_\_mempcpy\_chk() shall function in the same way as the interface memp-cpy(), except that \_\_mempcpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_mempcpy\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_memset\_chk

#### Name

\_\_memset\_chk — fill memory with a constant byte, using buffer overflow checking

## **Synopsis**

```
#include <string.h>
void * __memset_chk(void * dest, int c, size_t len, size_t destlen);
```

# **Description**

The interface \_\_memset\_chk() shall function in the same way as the interface memset(), except that \_\_memset\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_memset\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_pread64\_chk

#### **Name**

\_\_pread64\_chk — read from a file descriptor at a given offset, with buffer overflow checking

## **Synopsis**

```
#include <unistd.h>
ssize_t __pread64_chk(int fd, void * buf, size_t nbytes, off64_t
offset, size_t buflen);
```

## **Description**

The interface \_\_pread64\_chk() shall function in the same way as the interface pread64(), except that \_\_pread64\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *nbytes* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_pread64\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_pread\_chk

#### Name

\_\_pread\_chk — read from a file descriptor at a given offset, with buffer overflow checking

# **Synopsis**

```
#include <unistd.h>
ssize_t __pread_chk(int fd, void * buf, size_t nbytes, off_t offset,
size_t buflen);
```

# **Description**

The interface \_\_pread\_chk() shall function in the same way as the interface pread(), except that \_\_pread\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *nbytes* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_pread\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_printf\_chk

#### **Name**

\_\_printf\_chk — format and print data, with stack checking

## **Synopsis**

```
#include <stdio.h>
int __printf_chk(int flag, const char * format);
```

## **Description**

The interface \_\_printf\_chk() shall function in the same way as the interface printf(), except that \_\_printf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_printf\_chk() function is not in the source standard; it is only in the binary standard.

#### rawmemchr

#### Name

```
__rawmemchr — scan memory
```

## **Synopsis**

```
#include <string.h>
void * __rawmemchr(const void * s, int c);
```

# **Description**

The  $\_$ rawmemchr() function shall locate the first occurrence of c (converted to an unsigned char) in the object pointed to by s. If the byte does not occur in the object, then the behavior is undefined.

 $\_$ rawmemchr() is a weak alias for rawmemchr(). It is similar to memchr(), but it has no length limit.

\_\_rawmemchr() is not in the source standard; it is only in the binary standard.

#### **Return Value**

The \_\_rawmemchr() function shall return a pointer to the located byte.

#### \_\_read\_chk

#### **Name**

\_\_read\_chk — read from a file descriptor, with buffer overflow checking

## **Synopsis**

```
#include <unistd.h>
ssize_t __read_chk(int fd, void * buf, size_t nbytes, size_t
buflen);
```

# **Description**

The interface \_\_read\_chk() shall function in the same way as the interface read(), except that \_\_read\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *nbytes* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_read\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_readlink\_chk

#### **Name**

\_\_readlink\_chk — display value of a symbolic link, with buffer overflow checking

## **Synopsis**

```
#include <unistd.h>
ssize_t __readlink_chk(const char * path, char * buf, size_t len,
size_t buflen);
```

# **Description**

The interface \_\_readlink\_chk() shall function in the same way as the interface readlink(), except that \_\_readlink\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_readlink\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_realpath\_chk

#### **Name**

\_\_realpath\_chk — return the canonicalized absolute pathname, with buffer overflow checking

# **Synopsis**

```
#include <stdlib.h>
char * __realpath_chk(const char * path, char * resolved_path, size_t
resolved_len);
```

## **Description**

The interface \_\_realpath\_chk() shall function in the same way as the interface realpath(), except that \_\_realpath\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *resolved\_len* specifies the size of the string *resolved\_path*. If *resolved\_len* is less than PATH\_MAX, then the function shall abort, and the program calling it shall exit.

The \_\_realpath\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_recv\_chk

#### **Name**

\_\_recv\_chk — receive a message from a socket, with buffer overflow checking

# **Synopsis**

```
#include <sys/socket.h>
ssize_t __recv_chk(int fd, void * buf, size_t len, size_t buflen,
int flag);
```

# **Description**

The interface \_\_recv\_chk() shall function in the same way as the interface recv(), except that \_\_recv\_chk() shall check for buffer overflow before computing a result, depending on the value of the flag parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the buffer, parameter values, and so on.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_recv\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_recvfrom\_chk

#### **Name**

\_\_recvfrom\_chk — receive a message from a socket, with buffer overflow checking

## **Synopsis**

```
#include <sys/socket.h>
ssize_t __recvfrom_chk(int fd, void * buf, size_t len, size_t
buflen, int flag, struct sockaddr * from, socklen_t * fromlen);
```

## **Description**

The interface \_\_recvfrom\_chk() shall function in the same way as the interface recvfrom(), except that \_\_recvfrom\_chk() shall check for buffer overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the buffer, parameter values, and so on.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The \_\_recvfrom\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_register\_atfork

#### **Name**

```
__register_atfork — alias for register_atfork
```

# **Synopsis**

```
int __register_atfork(void (*prepare) (void), void (*parent) (void),
void (*child) (void), void *__dso_handle);
```

# **Description**

\_\_register\_atfork() implements pthread\_atfork() as specified in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009). The additional parameter \_\_dso\_handle allows a shared object to pass in it's handle so that functions registered by \_\_register\_atfork() can be unregistered by the runtime when the shared object is unloaded.

#### \_\_sigsetjmp

#### **Name**

\_\_sigsetjmp — save stack context for non-local goto

## **Synopsis**

```
int __sigsetjmp(jmp_buf env, int savemask);
```

## **Description**

\_\_sigsetjmp() has the same behavior as sigsetjmp() as specified by <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009).

\_\_sigsetjmp() is not in the source standard; it is only in the binary standard.

#### \_\_snprintf\_chk

#### **Name**

\_\_snprintf\_chk — convert formatted output, with buffer overflow checking

## **Synopsis**

```
#include <stdio.h>
int __snprintf_chk(char * str, size_t maxlen, int flag, size_t
strlen, const char * format);
```

## **Description**

The interface \_\_snprintf\_chk() shall function in the same way as the interface sn-printf(), except that \_\_snprintf\_chk() shall check for buffer overflow before computing a result, depending on the value of the flag parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the buffer, parameter values, and so on.

The parameter *strlen* specifies the size of the buffer *str*. If *strlen* is less than *maxlen*, the function shall abort, and the program calling it shall exit.

The \_\_snprintf\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_sprintf\_chk

#### **Name**

\_\_sprintf\_chk — convert formatted output, with stack checking

## **Synopsis**

```
#include <stdio.h>
int __sprintf_chk(char * str, int flag, size_t strlen, const char *
format);
```

# **Description**

The interface \_\_sprintf\_chk() shall function in the same way as the interface sprintf(), except that \_\_sprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *strlen* specifies the size of the string *str*. If *strlen* is zero, the function shall abort, and the program calling it shall exit.

The \_\_sprintf\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_stack\_chk\_fail

#### Name

\_\_stack\_chk\_fail — terminate a function in case of stack overflow

# **Synopsis**

```
void __stack_chk_fail(void);
```

# **Description**

The interface \_\_stack\_chk\_fail() shall abort the function that called it with a message that a stack overflow has been detected. The program that called the function shall then exit.

The \_\_stack\_chk\_fail() function is not in the source standard; it is only in the binary standard.

# **Application Usage (informative)**

The interface \_\_stack\_chk\_fail() does not check for a stack overflow itself. It merely reports one when invoked.

#### \_\_stpcpy

#### **Name**

```
__stpcpy — alias for stpcpy
```

# **Synopsis**

```
#include <string.h>
char * __stpcpy(char * dest, const char * src);
```

## **Description**

The  $\_$ stpcpy() function has the same specification as the stpcpy().

\_stpcpy() is not in the source standard; it is only in the binary standard.

## \_\_stpcpy\_chk

#### **Name**

\_\_stpcpy\_chk — copy a string returning a pointer to its end, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
char * __stpcpy_chk(char * dest, const char * src, size_t destlen);
```

## **Description**

The interface \_\_stpcpy\_chk() shall function in the same way as the interface stp-cpy(), except that \_\_stpcpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The \_\_stpcpy\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_stpncpy\_chk

#### **Name**

\_\_stpncpy\_chk — copy a fixed-size string, returning a pointer to its end, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
char * __stpncpy_chk(char * dest, const char * src, size_t n, size_t
destlen);
```

#### **Description**

The interface \_\_stpncpy\_chk() shall function in the same way as the interface stpncpy(), except that \_\_stpncpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *n* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The \_\_stpncpy\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_strcat\_chk

#### **Name**

\_\_strcat\_chk — concatenate two strings, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
char * __strcat_chk(char * dest, const char * src, size_t destlen);
```

# **Description**

The interface \_\_strcat\_chk() shall function in the same way as the interface strcat(), except that \_\_strcat\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter destlen specifies the size of the object pointed to by dest.

The \_\_strcat\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_strcpy\_chk

#### **Name**

\_\_strcpy\_chk — copy a string, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
char * __strcpy_chk(char * dest, const char * src, size_t destlen);
```

## **Description**

The interface \_\_strcpy\_chk() shall function in the same way as the interface strcpy(), except that \_\_strcpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The \_\_strcpy\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_strdup

#### **Name**

```
__strdup — alias for strdup
```

## **Synopsis**

```
char * __strdup(const char * string);
```

# **Description**

```
__strdup() has the same specification as strdup().
```

\_\_strdup() is not in the source standard; it is only in the binary standard.

### \_\_strncat\_chk

#### Name

\_\_strncat\_chk — concatenate two strings, with buffer overflow checking

# **Synopsis**

```
#include <string.h>
char * __strncat_chk(char * s1, const char * s2, size_t n, size_t
s1len);
```

# **Description**

The interface \_\_strncat\_chk() shall function in the same way as the interface strncat(), except that \_\_strncat\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *s11en* specifies the size of the object pointed to by *s1*.

The \_\_strncat\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_strncpy\_chk

#### **Name**

\_\_strncpy\_chk — copy a string, with buffer overflow checking

## **Synopsis**

```
#include <string.h>
char * __strncpy_chk(char * s1, const char * s2, size_t n, size_t
s1len);
```

# **Description**

The interface \_\_strncpy\_chk() shall function in the same way as the interface strncpy(), except that \_\_strncpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *s11en* specifies the size of the object pointed to by *s1*.

The \_\_strncpy\_chk() function is not in the source standard; it is only in the binary standard.

#### \_\_strtod\_internal

### **Name**

\_\_strtod\_internal — underlying function for strtod

# **Synopsis**

```
double __strtod_internal(const char * __nptr, char * * __endptr, int
__group);
```

# **Description**

```
\_\_\textit{group} shall be 0 or the behavior of \_\_\textit{strtod\_internal()} is undefined.
```

```
\_strtod_internal(\_nptr, \_endptr, 0)() has the same specification as strtod(\_nptr, \_endptr)().
```

\_\_strtod\_internal() is not in the source standard; it is only in the binary standard.

#### \_\_strtof\_internal

#### **Name**

\_\_strtof\_internal — underlying function for strtof

## **Synopsis**

float \_\_strtof\_internal(const char \* \_\_nptr, char \* \* \_\_endptr, int
\_\_group);

## **Description**

```
\_\_group shall be 0 or the behavior of \_\_strtof\_internal() is undefined.
```

```
\_strtof_internal(\_nptr, \_endptr, 0)() has the same specification as strtof(\_nptr, \_endptr)().
```

\_\_strtof\_internal() is not in the source standard; it is only in the binary standard.

#### \_\_strtok\_r

#### **Name**

\_\_strtok\_r — alias for strtok\_r

# **Synopsis**

```
char * __strtok_r(char * restrict s, const char * restrict delim,
char * restrict save_ptr);
```

## **Description**

```
__strtok_r() has the same specification as strtok_r().
```

\_\_strtok\_r() is not in the source standard; it is only in the binary standard.

#### \_\_strtol\_internal

#### **Name**

\_\_strtol\_internal — alias for strtol

# **Synopsis**

```
long int __strtol_internal(const char * __nptr, char * * __endptr, int
__base, int __group);
```

# **Description**

```
__group shall be 0 or the behavior of __strtol_internal() is undefined.
```

```
__strtol_internal(__nptr, __endptr, __base, 0) has the same specification as strtol(__nptr, __endptr, __base).
```

\_\_strtol\_internal() is not in the source standard; it is only in the binary standard.

### \_\_strtold\_internal

#### **Name**

\_\_strtold\_internal — underlying function for strtold

## **Synopsis**

long double \_\_strtold\_internal(const char \* \_\_nptr, char \* \* \_\_endptr,
int \_\_group);

## **Description**

- $\_\_group$  shall be 0 or the behavior of  $\_\_strtold\_internal()$  is undefined.
- $\_$ strtold\_internal( $\_$ nptr,  $\_$ endptr, 0) has the same specification as strtold( $\_$ nptr,  $\_$ endptr).
- \_\_strtold\_internal() is not in the source standard; it is only in the binary standard.

### strtoll internal

### **Name**

\_\_strtoll\_internal — underlying function for strtoll

## **Synopsis**

long long \_\_strtoll\_internal(const char \* \_\_nptr, char \* \* \_\_endptr,
int \_\_base, int \_\_group);

## **Description**

- \_\_group shall be 0 or the behavior of \_\_strtoll\_internal() is undefined.
- \_\_strtoll\_internal(\_\_nptr, \_\_endptr, \_\_base, 0) has the same specification as strtoll(\_\_nptr, \_\_endptr, \_\_base).
- \_\_strtoll\_internal() is not in the source standard; it is only in the binary standard.

### \_\_strtoul\_internal

### Name

\_\_strtoul\_internal — underlying function for strtoul

# **Synopsis**

unsigned long int \_\_strtoul\_internal(const char \* \_\_nptr, char \* \*
\_\_endptr, int \_\_base, int \_\_group);

# **Description**

- \_\_group shall be 0 or the behavior of \_\_strtoul\_internal() is undefined.
- \_\_strtoul\_internal(\_\_nptr, \_\_endptr, \_\_base, 0) has the same specification as strtoul(\_\_nptr, \_\_endptr, \_\_base).
- \_\_strtoul\_internal() is not in the source standard; it is only in the binary standard.

### \_\_strtoull\_internal

#### **Name**

\_\_strtoull\_internal — underlying function for strtoull

## **Synopsis**

```
unsigned long long __strtoull_internal(const char * __nptr, char * *
__endptr, int __base, int __group);
```

### **Description**

```
__group shall be 0 or the behavior of __strtoull_internal() is undefined.
__strtoull_internal(__nptr, __endptr, __base, 0) has the same specification as strtoull(__nptr, __endptr, __base).
__strtoull_internal() is not in the source standard; it is only in the binary standard.
```

### \_\_swprintf\_chk

### **Name**

\_\_swprintf\_chk — convert formatted wide-character output, with stack checking

# **Synopsis**

```
#include <wchar.h>
int __swprintf_chk(wchar_t * s, size_t n, int flag, size_t slen,
const wchar_t * format);
```

## **Description**

The interface \_\_swprintf\_chk() shall function in the same way as the interface swprintf(), except that \_\_swprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If *slen* is less than *maxlen*, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_swprintf\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_sysconf

#### **Name**

\_\_sysconf — get configuration information at runtime

## **Synopsis**

```
#include <unistd.h>
long __sysconf(int name);
```

## **Description**

- \_\_sysconf() gets configuration information at runtime.
- \_\_sysconf() is weak alias to sysconf().
- \_\_sysconf() has the same specification as sysconf().
- \_\_sysconf() is not in the source standard; it is only in the binary standard.

### \_\_syslog\_chk

### **Name**

\_\_syslog\_chk — send messages to the system logger, with stack checking

## **Synopsis**

```
#include <syslog.h>
void __syslog_chk(int priority, int flag, const char * format);
```

## **Description**

The interface \_\_syslog\_chk() shall function in the same way as the interface syslog(), except that \_\_syslog\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_syslog\_chk() function is not in the source standard; it is only in the binary standard.

# \_\_sysv\_signal

### **Name**

```
__sysv_signal — signal handling
```

# **Synopsis**

```
__sighandler_t __sysv_signal(int sig, __sighandler_t handler);
```

# **Description**

\_\_sysv\_signal() has the same behavior as signal() as specified by <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009).

\_\_sysv\_signal() is not in the source standard; it is only in the binary standard.

### timezone

#### **Name**

<u>\_\_timezone</u> — external variable containing timezone

## **Synopsis**

long int \_\_timezone;

## **Description**

The external variable \_\_timezone shall implement the timezone variable timezone as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. \_\_timezone has the same specification as timezone.

### \_\_ttyname\_r\_chk

#### **Name**

\_\_ttyname\_r\_chk — return name of a terminal, with buffer overflow checking (reentrant)

## **Synopsis**

```
#include <unistd.h>
int __ttyname_r_chk(int fd, char * buf, size_t buflen, size_t nreal);
```

## **Description**

The interface \_\_ttyname\_r\_chk() shall function in the same way as the interface ttyname\_r(), except that \_\_ttyname\_r\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the object pointed to by *buf*. If *buflen* exceeds *nreal*, the function shall abort and the program calling it shall exit.

The \_\_ttyname\_r\_chk() function is not in the source standard; it is only in the binary standard.

#### tzname

#### **Name**

\_\_tzname — external variable containing the timezone names

# **Synopsis**

```
char * __tzname[2];
```

# **Description**

The external variable  $\_$ tzname shall implement the timezone name variable tzname as specified in  $\underline{POSIX\ 1003.1-2008\ (ISO/IEC\ 9945-2009)}$  function tzset().  $\_$ tzname has the same specification as tzname.

## \_\_vfprintf\_chk

#### **Name**

\_\_vfprintf\_chk — convert formatted output, with stack checking

## **Synopsis**

```
#include <stdio.h>
int __vfprintf_chk(FILE * fp, int flag, const char * format, va_list
ap);
```

## **Description**

The interface \_\_vfprintf\_chk() shall function in the same way as the interface vf-printf(), except that \_\_vfprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the flag parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_vfprintf\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_vfwprintf\_chk

#### **Name**

\_\_vfwprintf\_chk — convert formatted wide-character output, with stack checking

## **Synopsis**

```
#include <wchar.h>
int __vfwprintf_chk(FILE * fp, int flag, const wchar_t * format,
va_list ap);
```

# **Description**

The interface \_\_vfwprintf\_chk() shall function in the same way as the interface vfwprintf(), except that \_\_vfwprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_vfwprintf\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_vprintf\_chk

#### **Name**

\_\_vprintf\_chk — convert formatted output, with stack checking

## **Synopsis**

```
#include <stdio.h>
int __vprintf_chk(int flag, const char * format, va_list ap);
```

## **Description**

The interface \_\_vprintf\_chk() shall function in the same way as the interface vprintf(), except that \_\_vprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_vprintf\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_vsnprintf\_chk

#### **Name**

\_\_vsnprintf\_chk — convert formatted output, with stack checking

## **Synopsis**

```
#include <stdio.h>
int __vsnprintf_chk(char * s, size_t maxlen, int flag, size_t slen,
const char * format, va_list args);
```

# **Description**

The interface \_\_vsnprintf\_chk() shall function in the same way as the interface vs-nprintf(), except that \_\_vsnprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the flag parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If *slen* is less than *maxlen*, the function shall abort and the program calling it shall exit.

In general, the higher the value of flag, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_vsnprintf\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_vsprintf\_chk

#### **Name**

\_\_vsprintf\_chk — convert formatted output, with stack checking

## **Synopsis**

```
#include <stdio.h>
int __vsprintf_chk(char * s, int flag, size_t slen, const char *
format, va_list args);
```

## **Description**

The interface \_\_vsprintf\_chk() shall function in the same way as the interface vs-printf(), except that \_\_vsprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If its value is zero, the function shall abort and the program calling it shall exit.

The \_\_vsprintf\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_vswprintf\_chk

#### Name

\_\_vswprintf\_chk — convert formatted wide-character output, with stack checking

# **Synopsis**

```
#include <wchar.h>
int __vswprintf_chk(wchar_t * s, size_t maxlen, int flag, size_t
slen, const wchar_t * format, va_list args);
```

# **Description**

The interface \_\_vswprintf\_chk() shall function in the same way as the interface vswprintf(), except that \_\_vswprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If *slen* is less than *maxlen*, the function shall abort and the program calling it shall exit.

The \_\_vswprintf\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_vsyslog\_chk

#### **Name**

\_\_vsyslog\_chk — send messages to the system logger, with stack checking

## **Synopsis**

```
#include <syslog.h>
void __vsyslog_chk(int priority, int flag, const char * format,
va_list ap);
```

## **Description**

The interface \_\_vsyslog\_chk() shall function in the same way as the interface vsyslog(), except that \_\_vsyslog\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_vsyslog\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_vwprintf\_chk

#### **Name**

\_\_vwprintf\_chk — convert formatted wide-character output, with stack checking

## **Synopsis**

```
#include <wchar.h>
int __vwprintf_chk(int flag, const wchar_t * format, va_list ap);
```

# **Description**

The interface \_\_vwprintf\_chk() shall function in the same way as the interface vw-printf(), except that \_\_vwprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the flag parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_vwprintf\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcpcpy\_chk

### **Name**

\_\_wcpcpy\_chk — copy a wide-character string, returning a pointer to its end, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wcpcpy_chk(wchar_t * dest, const wchar_t * src, size_t
destlen);
```

## **Description**

The interface \_\_wcpcpy\_chk() shall function in the same way as the interface wcp-cpy(), except that \_\_wcpcpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The \_\_wcpcpy\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcpncpy\_chk

### **Name**

\_\_wcpncpy\_chk — copy a fixed-size string of wide characters, returning a pointer to its end, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wcpncpy_chk(wchar_t * dest, const wchar_t * src, size_t
n, size_t destlen);
```

# **Description**

The interface \_\_wcpncpy\_chk() shall function in the same way as the interface wcpncpy(), except that \_\_wcpncpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *n* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The \_\_wcpncpy\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcrtomb\_chk

### **Name**

\_\_wcrtomb\_chk — convert a wide character to a multibyte sequence, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
size_t __wcrtomb_chk(char * s, wchar_t wchar, mbstate_t * ps, size_t
buflen);
```

## **Description**

The interface \_\_wcrtomb\_chk() shall function in the same way as the interface wcrtomb(), except that \_\_wcrtomb\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the object pointed to by *s*. If it is less than MB\_CUR\_MAX, then the function shall abort and the program calling it shall exit.

The \_\_wcrtomb\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcscat\_chk

### Name

\_\_wcscat\_chk — concatenate two wide-character strings, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wcscat_chk(wchar_t * dest, const wchar_t * src, size_t
destlen);
```

# **Description**

The interface \_\_wcscat\_chk() shall function in the same way as the interface wc-scat(), except that \_\_wcscat\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The \_\_wcscat\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcscpy\_chk

#### **Name**

\_\_wcscpy\_chk — copy a wide-character string, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wcscpy_chk(wchar_t * dest, const wchar_t * src, size_t
n);
```

## **Description**

The interface \_\_wcscpy\_chk() shall function in the same way as the interface wc-scpy(), except that \_\_wcscpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The \_\_wcscpy\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcsncat\_chk

### **Name**

\_\_wcsncat\_chk — concatenate two wide-character strings, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wcsncat_chk(wchar_t * dest, const wchar_t * src, size_t
n, size_t destlen);
```

# **Description**

The interface \_\_wcsncat\_chk() shall function in the same way as the interface wc-sncat(), except that \_\_wcsncat\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The \_\_wcsncat\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcsncpy\_chk

#### **Name**

\_\_wcsncpy\_chk — copy a fixed-size string of wide characters, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wcsncpy_chk(wchar_t * dest, const wchar_t * src, size_t
n, size_t destlen);
```

## **Description**

The interface \_\_wcsncpy\_chk() shall function in the same way as the interface wc-sncpy(), except that \_\_wcsncpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The \_\_wcsncpy\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcsnrtombs\_chk

#### Name

\_\_wcsnrtombs\_chk — convert a wide-character string to a multibyte string, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
size_t __wcsnrtombs_chk(char * dest, const wchar_t * * src, size_t
nwc, size_t len, mbstate_t * ps, size_t destlen);
```

# **Description**

The interface \_\_wcsnrtombs\_chk() shall function in the same way as the interface wcsnrtombs(), except that \_\_wcsnrtombs\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The \_\_wcsnrtombs\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_wcsrtombs\_chk

### **Name**

\_\_wcsrtombs\_chk — convert a wide-character string to a multibyte string, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
size_t __wcsrtombs_chk(char * dest, const wchar_t * * src, size_t
len, mbstate_t * ps, size_t destlen);
```

## **Description**

The interface \_\_wcsrtombs\_chk() shall function in the same way as the interface wc-srtombs(), except that \_\_wcsrtombs\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The \_\_wcsrtombs\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcstod\_internal

### **Name**

\_\_wcstod\_internal — underlying function for wcstod

## **Synopsis**

```
double __wcstod_internal(const wchar_t * nptr, wchar_t * * endptr,
int group);
```

# **Description**

group shall be 0 or the behavior of \_\_wcstod\_internal() is undefined.

```
__wcstod_internal(nptr, endptr, 0) shall behave as wcstod(nptr, endptr) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).
```

\_\_wcstod\_internal() is not in the source standard; it is only in the binary standard.

### \_\_wcstof\_internal

#### **Name**

\_\_wcstof\_internal — underlying function for wcstof

## **Synopsis**

float \_\_wcstof\_internal(const wchar\_t \* nptr, wchar\_t \* \* endptr, int
group);

## **Description**

group shall be 0 or the behavior of \_\_wcstof\_internal() is undefined.

\_\_wcstof\_internal(nptr, endptr, 0) shall behave as wcstof(nptr, endptr) as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

\_\_wcstof\_internal() is not in the source standard; it is only in the binary standard.

### \_\_wcstol\_internal

### **Name**

\_\_wcstol\_internal — underlying function for wcstol

## **Synopsis**

long \_\_wcstol\_internal(const wchar\_t \* nptr, wchar\_t \* \* endptr, int
base, int group);

## **Description**

group shall be 0 or the behavior of \_\_wcstol\_internal() is undefined.

\_\_wcstol\_internal(nptr, endptr, base, 0) shall behave as wcstol(nptr, endptr, base) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

\_\_wcstol\_internal() is not in the source standard; it is only in the binary standard.

### \_\_wcstold\_internal

### **Name**

\_\_wcstold\_internal — underlying function for wcstold

# **Synopsis**

long double \_\_wcstold\_internal(const wchar\_t \* nptr, wchar\_t \* \*
endptr, int group);

# **Description**

group shall be 0 or the behavior of  $\_$ wcstold\_internal() is undefined.

\_\_wcstold\_internal(nptr, endptr, 0) shall behave as wcstold(nptr, endptr) as specified by <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

\_\_wcstold\_internal() is not in the source standard; it is only in the binary standard.

### \_\_wcstombs\_chk

### **Name**

\_\_wcstombs\_chk — convert a wide-character string to a multibyte string, with buffer overflow checking

## **Synopsis**

```
#include <stdlib.h>
size_t __wcstombs_chk(char * dest, const wchar_t * src, size_t len,
size_t destlen);
```

## **Description**

The interface \_\_wcstombs\_chk() shall function in the same way as the interface wc-stombs(), except that \_\_wcstombs\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The \_\_wcstombs\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wcstoul\_internal

### **Name**

\_\_wcstoul\_internal — underlying function for wcstoul

## **Synopsis**

```
unsigned long __wcstoul_internal(const wchar_t * restrict nptr,
wchar_t * restrict endptr, int base, int group);
```

# **Description**

group shall be 0 or the behavior of \_\_wcstoul\_internal() is undefined.

\_\_wcstoul\_internal(nptr, endptr, base, 0)() shall behave as wc-stoul(nptr, endptr, base)() as specified by <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

\_\_wcstoul\_internal() is not in the source standard; it is only in the binary standard.

### \_\_wctomb\_chk

### **Name**

\_\_wctomb\_chk — convert a wide character to a multibyte sequence, with buffer overflow checking

## **Synopsis**

```
#include <stdlib.h>
int __wctomb_chk(char * s, wchar_t wchar, size_t buflen);
```

## **Description**

The interface \_\_wctomb\_chk() shall function in the same way as the interface wc-tomb(), except that \_\_wctomb\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the object pointed to by *s*. If it is less than MB\_CUR\_MAX, then the function shall abort and the program calling it shall exit.

The \_\_wctomb\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wmemcpy\_chk

### **Name**

\_\_wmemcpy\_chk — copy an array of wide-characters, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wmemcpy_chk(wchar_t * s1, const wchar_t * s2, size_t n,
size_t ns1);
```

# **Description**

The interface \_\_wmemcpy\_chk() shall function in the same way as the interface wmemcpy(), except that \_\_wmemcpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *ns1* specifies the size of the object pointed to by *s1*. If *n* exceeds *ns1*, the function shall abort and the program calling it shall exit.

The \_\_wmemcpy\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wmemmove\_chk

### **Name**

\_\_wmemmove\_chk — copy an array of wide-characters, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wmemmove_chk(wchar_t * s1, const wchar_t * s2, size_t
n, size_t ns1);
```

## **Description**

The interface \_\_wmemmove\_chk() shall function in the same way as the interface wmemmove(), except that \_\_wmemmove\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *ns1* specifies the size of the object pointed to by *s1*. If *n* exceeds *ns1*, the function shall abort and the program calling it shall exit.

The \_\_wmemmove\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_wmempcpy\_chk

### **Name**

\_\_wmempcpy\_chk — copy memory area, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wmempcpy_chk(wchar_t * s1, const wchar_t * s2, size_t
n, size_t ns1);
```

# **Description**

The interface \_\_wmempcpy\_chk() shall function in the same way as the interface wmempcpy(), except that \_\_wmempcpy\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *ns1* specifies the size of the object pointed to by *s1*. If *n* exceeds *ns1*, the function shall abort and the program calling it shall exit.

The \_\_wmempcpy\_chk() function is not in the source standard; it is only in the binary standard.

### \_\_wmemset\_chk

### **Name**

\_\_wmemset\_chk — fill an array of wide-characters with a constant wide character, with buffer overflow checking

## **Synopsis**

```
#include <wchar.h>
wchar_t * __wmemset_chk(wchar_t * s, wchar_t c, size_t n, size_t
destlen);
```

## **Description**

The interface \_\_wmemset\_chk() shall function in the same way as the interface wmemset(), except that \_\_wmemset\_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *s*. If *n* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The \_\_wmemset\_chk() function is not in the source standard; it is only in the binary standard.

## \_\_wprintf\_chk

#### **Name**

\_\_wprintf\_chk — convert formatted wide-character output, with stack checking

## **Synopsis**

```
#include <wchar.h>
int __wprintf_chk(int flag, const wchar_t * format);
```

# **Description**

The interface \_\_wprintf\_chk() shall function in the same way as the interface wprintf(), except that \_\_wprintf\_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The \_\_wprintf\_chk() function is not in the source standard; it is only in the binary standard.

### xmknod

### Name

\_\_xmknod — make a special file

## **Synopsis**

```
#include <sys/stat.h>
int __xmknod(int ver, const char * path, mode_t mode, dev_t * dev);
```

### **Description**

The \_\_xmknod() function shall implement the mknod() interface. The behavior of \_\_xmknod() for values of *ver* other than \_MKNOD\_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of \_MKNOD\_VER.

\_\_xmknod(\_MKNOD\_VER, path, mode, dev) shall behave as mknod(path, mode, dev) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

The \_\_xmknod() function is not in the source standard; it is only in the binary standard.

Note: The mknod() function is not in the binary standard; it is only in the source standard.

### \_\_xmknodat

### Name

\_\_xmknodat — make a special file relative to a directory file descriptor

## **Synopsis**

```
#include <sys/stat.h>
int __xmknodat(int ver, int dirfd, const char * path, mode_t path,
dev_t * dev);
```

# **Description**

The \_\_xmknodat() function shall implement the mknodat() function. The behavior of \_\_xmknodat() for values of *ver* other than \_MKNOD\_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of \_MKNOD\_VER.

\_\_xmknodat(\_MKNOD\_VER, dirfd, path, mode, dev) shall behave as mknodat(dirfd, path, mode, dev) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

The \_\_xmknodat() function is not in the source standard; it is only in the binary standard.

**Note:** The mknodat() function is not in the binary standard; it is only in the source standard.

### \_\_xpg\_basename

### **Name**

\_\_xpg\_basename — return the last component of a file name

## **Synopsis**

```
#include <libgen.h>
char * __xpg_basename(const char * path);
```

## **Description**

The \_\_xpg\_basename() function shall return a pointer to the final component of the pathname named by *path*, as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> basename().

This function is not in the source standard, it is only in the binary standard.

## **Return Value**

See POSIX 1003.1-2008 (ISO/IEC 9945-2009).

## \_\_xpg\_sigpause

### **Name**

\_\_xpg\_sigpause — remove a signal from the signal mask and suspend the thread

## **Synopsis**

```
#include <signal.h>
int __xpg_signause(int sig);
```

# **Description**

The \_\_xpg\_signause() function shall implement the signause() described in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

This function is not in the source standard, it is only in the binary standard.

### **Return Value**

See POSIX 1003.1-2008 (ISO/IEC 9945-2009).

236

### \_\_xpg\_strerror\_r

#### **Name**

\_\_xpg\_strerror\_r — return string describing error number

## **Synopsis**

```
#include <string.h>
int __xpg_strerror_r(int errnum, char * buf, size_t buflen);
```

### **Description**

The \_\_xpg\_strerror\_r() function shall map the error number in *errnum* to a locale-dependent error message string and shall return the string in the buffer pointed to by *strerrbuf*, with length *buflen*, as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> strerror\_r().

This function is not in the source standard, it is only in the binary standard.

#### **Return Value**

See POSIX 1003.1-2008 (ISO/IEC 9945-2009).

#### \_\_xstat

### Name

```
__xstat — get File Status
```

## **Synopsis**

```
#include <sys/stat.h>
#include <unistd.h>
int __xstat(int ver, const char * path, struct stat * stat_buf);
int __lxstat(int ver, const char * path, struct stat * stat_buf);
int __fxstat(int ver, int fildes, struct stat * stat_buf);
```

# **Description**

The functions \_\_xstat(), \_\_lxstat(), and \_\_fxstat() shall implement the functions stat(), lstat(), and fstat() respectively.

The behavior of these functions for values of *ver* other than \_STAT\_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of \_STAT\_VER.

\_\_xstat(\_STAT\_VER, path, stat\_buf) shall implement stat(path, stat\_buf) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

\_\_lxstat(\_STAT\_VER, path, stat\_buf) shall implement lstat(path, stat\_buf) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

\_\_fxstat(\_STAT\_VER, fildes, stat\_buf) shall implement fstat(fildes, stat\_buf) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

\_\_xstat(), \_\_lxstat(), and \_\_fxstat() are not in the source standard; they are only in the binary standard.

stat(), lstat(), and fstat() are not in the binary standard; they are only in the source standard.

#### xstat64

#### **Name**

\_\_xstat64 — get File Status

## **Synopsis**

```
#define _LARGEFILE_SOURCE 1
#include <sys/stat.h>
#include <unistd.h>
int __xstat64(int ver, const char * path, struct stat64 * stat_buf);
int __lxstat64(int ver, const char * path, struct stat64 * stat_buf);
int __fxstat64(int ver, int fildes, struct stat64 * stat_buf);
```

## **Description**

The functions \_\_xstat64(), \_\_lxstat64(), and \_\_fxstat64() shall implement the functions stat64(), lstat64(), and fstat64() respectively.

The behavior of these functions for values of *ver* other than \_STAT\_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of \_STAT\_VER.

```
__xstat64(_STAT_VER, path, stat_buf) shall behave as stat64(path, stat_buf) as specified by Large File Support.
```

\_\_lxstat64(\_STAT\_VER, path, stat\_buf) shall behave as lstat64(path, stat\_buf) as specified by <u>Large File Support</u>.

\_\_fxstat64(\_STAT\_VER, fildes,  $stat_buf$ ) shall behave as fstat64(fildes,  $stat_buf$ ) as specified by <u>Large File Support</u>.

\_\_xstat64(), \_\_lxstat64(), and \_\_fxstat64() are not in the source standard; they are only in the binary standard.

stat64(), lstat64(), and fstat64() are not in the binary standard; they are only in the source standard.

### environ

#### Name

\_environ — alias for environ - user environment

# **Synopsis**

extern char \* \*\_environ;

# **Description**

\_environ is an alias for environ - user environment.

### \_nl\_msg\_cat\_cntr

#### Name

\_nl\_msg\_cat\_cntr — new catalog load counter

# **Synopsis**

#include <libintl.h>

extern int \_nl\_msg\_cat\_cntr;

## **Description**

The global variable \_nl\_msg\_cat\_cntr is incremented each time a new catalog is loaded. This variable is only in the binary standard; it is not in the source standard.

## \_sys\_errlist

#### **Name**

\_sys\_errlist — array containing the "C" locale strings used by strerror()

## **Synopsis**

```
#include <stdio.h>
extern const char *const _sys_errlist[];
```

## **Description**

\_sys\_errlist is an array containing the "C" locale strings used by strerror(). This normally should not be used directly. strerror() provides all of the needed functionality.

## \_sys\_siglist

### Name

\_sys\_siglist — array containing the names of the signal names

## **Synopsis**

```
#include <signal.h>
extern const char *const _sys_siglist[NSIG];
```

# **Description**

\_sys\_siglist is an array containing signal description strings ordered by signal number.

The \_sys\_siglist array is only in the binary standard; it is not in the source standard. Applications wishing to access signal descriptions should use the strsignal() function

#### acct

### **Name**

acct — switch process accounting on or off

## **Synopsis**

```
#include <dirent.h>
int acct(const char * filename);
```

## **Description**

When *filename* is the name of an existing file, acct() turns accounting on and appends a record to *filename* for each terminating process. When *filename* is NULL, acct() turns accounting off.

#### **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

### **Errors**

#### **ENOSYS**

BSD process accounting has not been enabled when the operating system kernel was compiled. The kernel configuration parameter controlling this feature is <code>CONFIG\_BSD\_PROCESS\_ACCT</code>.

#### **ENOMEM**

Out of memory.

#### **EPERM**

The calling process has no permission to enable process accounting.

### **EACCES**

filename is not a regular file.

#### EIO

Error writing to the filename.

#### **EUSERS**

There are no more free file structures or we run out of memory.

### adjtime

### Name

adjtime — correct the time to allow synchronization of the system clock

## **Synopsis**

```
#include <time.h>
int adjtime(const struct timeval * delta, struct timeval *
olddelta);
```

## **Description**

adjtime() makes small adjustments to the system time as returned by gettimeof-day()(2), advancing or retarding it by the time specified by the timeval delta. If delta is negative, the clock is slowed down by incrementing it more slowly than normal until the correction is complete. If delta is positive, a larger increment than normal is used. The skew used to perform the correction is generally a fraction of one percent. Thus, the time is always a monotonically increasing function. A time correction from an earlier call to adjtime() may not be finished when adjtime() is called again. If olddelta is non-NULL, the structure pointed to will contain, upon return, the number of microseconds still to be corrected from the earlier call.

adjtime() may be used by time servers that synchronize the clocks of computers in a local area network. Such time servers would slow down the clocks of some machines and speed up the clocks of others to bring them to the average network time.

Appropriate privilege is required to adjust the system time.

### **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

### **Errors**

**EFAULT** 

An argument points outside the process's allocated address space.

**EPERM** 

The process does not have appropriate privilege.

## alphasort64

### Name

alphasort64 — Comparison function for directory scanning (Large File Support)

# **Synopsis**

#include <dirent.h>
int alphasort64(const struct dirent64 \*\* d1, const struct dirent64
\*\* d2):

# **Description**

alpahsort64() is a large-file version of the alphasort() function as defined in  $\underline{POSIX\ 1003.1-2008\ (ISO/IEC\ 9945-2009)}$ . If differs only in that the d1 and d2 parameters are of type dirent64 instead of type dirent.

argz\_add, argz\_add\_sep, argz\_append, argz\_count, argz\_create, argz\_create\_sep, argz\_delete, argz\_extract, argz\_insert, argz\_next, argz\_replace, argz\_stringify

#### **Name**

```
argz_add, argz_add_sep, argz_append, argz_count,
argz_create, argz_create_sep, argz_delete, argz_extract,
argz_insert, argz_next, argz_replace, argz_stringify—
Operate on argz vectors
```

## **Synopsis**

```
#include <argz.h>
error_t argz_add(char ** argz, size_t * argz_len, const char * str);
error_t argz_add_sep(char ** argz, size_t * argz_len, const char
str, int sep);
error_t argz_append(char ** argz, size_t * argz_len, const char *
buf, size_t buf_len);
size_t argz_count(const char * argz, size_t * argz_len);
error_t argz_create(char * const argv, char *
                                                            argz,
                                                                    size_t *
argz_len);
error_t argz_create_sep(const char * str, int sep, char ** argz,
size_t * argz_len);
void argz_delete(char ** argz, size_t * argz_len, char * entry);
void argz_extract(const char * argz, size_t argz_len, char ** argv);
error_t argz_insert(char ** argz_insert, size_t * argz_len, char *
before, const char * entry);
char argz_next(const char * argz, size_t argz_len, const char *
entry);
error_t argz_replace(char ** argz, size_t * argz_len, const char *
str, const char * with, unsigned int * replace_count);
void argz_stringify(char * argz, size_t argz_len, int sep);
```

## **Description**

The argz functions operate on argz vectors, which are typically used to more easily manipulate program arguments, of the form described in <u>ISO C (1999)</u> in section 5.1.2.2.1, Program Startup. While an argv is an array of character pointers to strings, an argz vector is a set of strings, separated by null characters, in contiguous memory; the vector is described by a pointer to the first element and a size. There is no limitation that the argz must be made up of program arguments.

The argz functions which change argz vectors expect them to use memory allocated using malloc(), and will themselves use malloc() or realloc().

The argz\_create() function converts an argv vector identified by argv to an argz vector with the same elements, identified by argz and argz\_len.

The argz\_create\_sep() function converts the string identified by str, spliting into a separate string at each occurence of sep, to an argz vector identified by argz and argz\_len.

The argz\_add() function adds the string identified by str to the vector identified by argz and argz\_len, updating argz and argz\_len.

The argz\_add\_sep() function adds the string identified by str, spliting into a separate string at each occurence of sep, to the vector identified by argz, updating argz and argz\_len.

The argz\_append() function appends the argz vector identified by buf and buf\_len to the argz vector identified by argz and argz\_len, thus updating argz and argz\_len.

The argz\_count() function returns the number of strings in the argz vector identified by argz and argz\_len.

The argz\_delete() function removes the string identified by entry from the the argz vector identified by argz, argz\_len, updating argz and argz\_len.

The argz\_extract() function performs the inverse of argz\_create(). It converts an argz vector identified by argz and argz\_len to an argv vector identified by argv with the same elements.

The argz\_insert() function inserts the string identified by entry at position before to the the argz vector identified by argz and argz\_len, updating argz and argz\_len.

The argz\_next() function returns the entry following the entry identified by entry in the argz vector identified by argz and argz\_len. If entry is NULL the first entry is returned. This function can be used to step through an argz vector by obtaining the first entry by passing NULL, then passing the just obtained value to the next call, and so on. NULL is returned if there is no following entry.

The argz\_replace() function replaces each occurrence of str in the argz vector identified by argz and argz\_len with with, updating argz and argz\_len. The counter pointed to by replace\_count will be incremented by the number of replacements unless NULL is passed for replace\_count.

The argz\_stringify() function performs the inverse of argz\_create\_sep(). It converts the argz vector identified by argz and argz\_len into a regular string, with the strings in the original vector separated by sep in the converted string. The conversion is done in place, so in effect each null byte in argz but the last one is replaced by sep.

### **Return Value**

All of the argz functions that perform memory allocation return an error\_t type. These functions return 0 on success; if memory allocation fails, they return ENOMEM.

argz\_count() returns a count of substrings in the argz vector as a size\_t type.

argz\_next() returns a pointer to a substring in an argz vector, or NULL.

envz add, envz entry, envz get, envz merge, envz remove, envz strip

## asprintf

### Name

asprintf — write formatted output to a dynamically allocated string

## **Synopsis**

```
#include <stdio.h> int asprintf(char ** restrict ptr, const char * restrict format, ...);
```

# **Description**

The asprintf() function shall behave as sprintf(), except that the output string shall be dynamically allocated space of sufficient length to hold the resulting string. The address of this dynamically allocated string shall be stored in the location referenced by *ptr*.

### **Return Value**

Refer to fprintf().

### **Errors**

Refer to fprintf().

### backtrace, backtrace\_symbols, backtrace\_symbols\_fd

#### **Name**

backtrace, backtrace\_symbols, backtrace\_symbols\_fd — runtime stack back tracing

## **Synopsis**

```
#include <execinfo.h>
int backtrace(void **array, int size);
char **backtrace_symbols(void *const *array, int size);
void backtrace_symbols_fd(void *const *array, int size, int fd);
```

## **Description**

backtrace() obtains a backtrace for the current thread as a list of pointers filled in to array. The size parameter describes the number of elements that will fit into array, backtrace() will truncate the list if necessary. A backtrace is a list of currently active function calls in a thread; each function call allocates a new stack frame and backtrace() obtains the return address from each stack frame.

backtrace\_symbols() translates the information obtained from backtrace() into an array of strings. *array* is a pointer to an array of addresses as obtained from backtrace(). *size* is the number of entries in *array*, and should be the return value of the call to backtrace(). The strings contain the function name if it can be determined, a hedxadecimal offset into the function, and the actual return address in hexadecimal. Note that the pointer returned by backtrace\_symbols() is obtained by an internal call to malloc() and should be freed when no longer needed.

backtrace\_symbols\_fd() performs the same transformation as backtrace\_symbols() given the same argument pair *array*, *size*, but writes the strings to the file descriptor contained in *fd*. This avoids the allocation of string space.

#### **Return Value**

backtrace() returns the number of entries placed into *array*, no more than *size*. If the value is less than *size*, the full backtrace was returned; else it may have been truncated.

On success, backtrace\_symbols() returns a pointer to an array of strings, which will have *size* entries. On error, NULL is returned.

### **Errors**

No errors are defined for these functions. If backtrace\_symbols\_fd() fails, it will be due to a failure in the call to malloc(), and errno will be set accordingly.

### **Notes**

The ability to obtain useful backtrace information, in particular function names, is dependent on a number of factors at the time of program construction, such as compiler optimization options. Even if the program itself is constructed so as to make symbols visible, the call trace may descend into system libraries which have not been so constructed.

Inlined functions do not have stack frames, and functions declared as static are not exposed and so will not be available in the backtrace.

### See Also

malloc()

#### basename

### **Name**

basename — return the last component of a file name

## **Synopsis**

```
#include <libgen.h>
char * basename(const char * path);
```

## **Description**

In the source standard, basename() is implemented as a macro causing it to behave as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, and is equivalent to the function \_\_xpg\_basename(). If the macro is undefined, basename() from the binary standard is used, with differences as described here:

The string identified by *path* shall not be modified.

If *path* is "/", or ends with a trailing '/' character, the basename() function shall return a pointer to an empty string.

### **Return Value**

On success, the basename() function shall return a pointer to the final component of *path*. Otherwise, it shall return a null pointer.

### See Also

```
__xpg_basename()
```

### bind\_textdomain\_codeset

#### **Name**

bind\_textdomain\_codeset — specify encoding for message retrieval

## **Synopsis**

```
#include <libintl.h>
char * bind_textdomain_codeset (const char * domainname , const char
* codeset );
```

## **Description**

The bind\_textdomain\_codeset() function can be used to specify the output codeset for message catalogs for domain *domainname*. The *codeset* argument shall be a valid codeset name which can be used tor the *iconv\_open* function, or a null pointer. If the *codeset* argument is the null pointer, then function returns the currently selected codeset for the domain with the name *domainname*. It shall return a null pointer if no codeset has yet been selected.

Each successive call to bind\_textdomain\_codeset() function overrrides the settings made by the preceding call with the same *domainname*.

The bind\_textdomain\_codeset() function shall return a pointer to a string containing the name of the selected codeset. The string shall be allocated internally in the function and shall not be changed or freed by the user.

#### **Parameters**

#### domainname

The *domainname* argument is applied to the currently active LC\_MESSAGE locale. It is equivalent in syntax and meaning to the *domainname* argument to *textdomain*, except that the selection of the domain is valid only for the duration of the call.

#### codeset

The name of the output codeset for the selected domain, or NULL to select the current codeset.

If domainname is the null pointer, or is an empty string, bind\_textdomain\_codeset() shall fail, but need not set errno.

### **Return Value**

Returns the currently selected codeset name. It returns a null pointer if no codeset has yet been selected.

#### **Errors**

#### **ENOMEM**

Insufficient memory available to allocate return value.

#### See Also

gettext, dgettext, ngettext, dngettext, dcgettext, dcngettext, textdomain, bindtextdomain

### bindresvport

#### **Name**

bindresvport — bind socket to privileged IP port

## **Synopsis**

```
#include <sys/types.h>
#include <rpc/rpc.h>
int bindresvport(int sd, struct sockaddr_in * sin);
```

### **Description**

If the process has appropriate privilege, the bindresvport() function shall bind a socket to an anonymous privileged IP port, that is, arbitrarily selected from the range 512 through 1023.

If the bind is successful and *sin* is not NULL, and the port number bound to is returned in the *sin\_port* member of *sin*. Any caller-supplied value of *sin\_port* is ignored.

If *sin* is NULL, the address family is taken to be AF\_INET and an available privileged port is bound to. Since there is no sockaddr\_in structure, the port number chosen cannot be returned. The getsockname() may be used to query for this information.

### **Return Value**

On success, 0 is returned. On error, -1 is returned and errno is set to indicate the error.

### **Errors**

bindresvport() may fail in the same way as bind() in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009). The following additional or differing failures may occur:

#### **EADDRINUSE**

All privileged ports are in use.

#### **EAFNOSUPPORT**

The specified address is not a valid address for the address family of the specified socket, or the address family is not supported.

#### **EPFNOSUPPORT**

The same meaning as EAFNOSUPPORT. Some older implementations may return this error instead.

**Note:** At this time, only AF\_INET is supported. Applications should be prepared for either the EAFNOSUPPORT or EPFNOSUPPORT error to be indicated.

#### bindtextdomain

#### Name

bindtextdomain — specify the location of a message catalog

## **Synopsis**

```
#include <libintl.h>
char * bindtextdomain(const char * domainname, const char * dirname);
```

## **Description**

The bindtextdomain() shall set the base directory of the hierarchy containing message catalogs for a given message domain.

The bindtextdomain() function specifies that the *domainname* message catalog can be found in the *dirname* directory hierarchy, rather than in the system default locale data base.

If *dirname* is not NULL, the base directory for message catalogs belonging to domain *domainname* shall be set to *dirname*. If *dirname* is NULL, the base directory for message catalogs shall not be altered.

The function shall make copies of the argument strings as needed.

dirname can be an absolute or relative pathname.

**Note:** Applications that wish to use chdir() should always use absolute pathnames to avoid misadvertently selecting the wrong or non-existant directory.

If *domainname* is the null pointer, or is an empty string, bindtextdomain() shall fail, but need not set errno.

The bindtextdomain() function shall return a pointer to a string containing the name of the selected directory. The string shall be allocated internally in the function and shall not be changed or freed by the user.

### **Return Value**

On success, bindtextdomain() shall return a pointer to a string containing the directory pathname currently bound to the domain. On failure, a NULL pointer is returned, and the global variable errno may be set to indicate the error.

### **Errors**

ENOMEM

Insufficient memory was available.

#### See Also

gettext, dgettext, ngettext, dngettext, dcngettext, textdomain, bind\_textdomain\_codeset

### cfmakeraw

### Name

cfmakeraw — get and set terminal attributes

## **Synopsis**

```
#include <termios.h>
void cfmakeraw(struct termios * termios_p);
```

## **Description**

The cfmakeraw() function shall set the attributes of the termios structure referenced by *termios\_p* as follows:

termios\_p shall point to a termios structure that contains the following members:

```
tcflag_t c_iflag; /* input modes */
tcflag_t c_oflag; /* output modes */
tcflag_t c_cflag; /* control modes */
tcflag_t c_lflag; /* local modes */
cc_t c_cc[NCCS]; /* control chars */
```

### cfsetspeed

### **Name**

cfsetspeed — set terminal input and output data rate

## **Synopsis**

```
#include <termios.h>
int cfsetspeed(struct termios *t, speed_t speed);
```

## **Description**

The cfsetspeed() function shall set the input and output speeds in t to the value specified by speed. The effects of the function on the terminal as described below do not become effective, nor are all errors detected, until the tcsetattr() function is called. Certain values for baud rates set in termios and passed to tcsetattr() have special meanings.

### **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

#### **Errors**

**EINVAL** 

Invalid speed argument

### clearerr\_unlocked

#### **Name**

clearerr\_unlocked — non-thread-safe clearerr

# **Description**

clearerr\_unlocked() is the same as clearerr(), except that it need not be threadsafe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

#### daemon

### **Name**

daemon — run in the background

# **Synopsis**

```
#include <unistd.h>
int daemon(int nochdir, int noclose);
```

# **Description**

The daemon() function shall create a new process, detached from the controlling terminal. If successful, the calling process shall exit and the new process shall continue to execute the application in the background. If *nochdir* evaluates to true, the current directory shall not be changed. Otherwise, daemon() shall change the current working directory to the root ('/'). If *noclose* evaluates to true the standard input, standard output, and standard error file descriptors shall not be altered. Otherwise, daemon() shall close the standard input, standard output and standard error file descriptors and reopen them attached to /dev/null.

### **Return Value**

On error, -1 is returned, and the global variable errno is set to any of the errors specified for the library functions fork() and setsid().

# dcgettext

### **Name**

dcgettext — perform domain and category specific lookup in message catalog

# **Synopsis**

#include <libintl.h>

```
#include <locale.h>
char * dcgettext(const char * domainname, const char * msgid, int
category);
```

# **Description**

The dcgettext() function is a domain specified version of gettext().

The dcgettext() function shall lookup the translation in the current locale of the message identified by <code>msgid</code> in the domain specified by <code>domainname</code> and in the locale category specified by <code>category</code>. If <code>domainname</code> is NULL, the current default domain shall be used. The <code>msgid</code> argument shall be a NULL-terminated string to be matched in the catalogue. <code>category</code> shall specify the locale category to be used for retrieving message strings. The category parameter shall be one of <code>LC\_CTYPE</code>, <code>LC\_COLLATE</code>, <code>LC\_MESSAGES</code>, <code>LC\_MONETARY</code>, <code>LC\_NUMERIC</code>, or <code>LC\_TIME</code>. The default domain shall not be changed by a call to <code>dcgettext()</code>.

### **Return Value**

If a translation was found in one of the specified catalogs, it shall be converted to the current locale's codeset and returned. The resulting NULL-terminated string shall be allocated by the degettext function, and must not be modified or freed. If no translation was found, or category was invalid, <code>msgid</code> shall be returned.

#### **Errors**

dcgettext() shall not modify the errno global variable.

### See Also

gettext, dgettext, ngettext, dngettext, dcngettext, textdomain, bindtextdomain, bind\_textdomain\_codeset

# dcngettext

#### Name

dcngettext — perform domain and category specific lookup in message catalog with plural

# **Synopsis**

#include <libintl.h>

#### LSB Core - Generic 5.0

```
#include <locale.h>
char * dcngettext(const char * domainname, const char * msgid1, const
char * msgid2, unsigned long int n, int category);
```

# **Description**

The dcngettext() function is a domain specific version of gettext, capable of returning either a singular or plural form of the message. The dcngettext() function shall lookup the translation in the current locale of the message identified by <code>msgid1</code> in the domain specified by <code>domainname</code> and in the locale category specified by <code>category</code>. If <code>domainname</code> is NULL, the current default domain shall be used. The <code>msgid1</code> argument shall be a NULL-terminated string to be matched in the catalogue. <code>category</code> shall specify the locale category to be used for retrieving message strings. The <code>category</code> parameter shall be one of <code>LC\_CTYPE</code>, <code>LC\_COLLATE</code>, <code>LC\_MESSAGES</code>, <code>LC\_MONETARY</code>, <code>LC\_NUMERIC</code>, or <code>LC\_TIME</code>. The default domain shall not be changed by a call to dcn-gettext(). If <code>n</code> is 1 then the singular version of the message is returned, otherwise one of the plural forms is returned, depending on the value of <code>n</code> and the current locale settings.

### **Return Value**

If a translation corresponding to the value of n was found in one of the specified catalogs for msgid1, it shall be converted to the current locale's codeset and returned. The resulting NULL-terminated string shall be allocated by the dcngettext() function, and must not be modified or freed. If no translation was found, or category was invalid, msgid1 shall be returned if n has the value 1, otherwise msgid2 shall be returned.

#### **Errors**

dcngettext() shall not modify the errno global variable.

### See Also

gettext, dgettext, ngettext, dngettext, dcgettext, textdomain, bindtextdomain, bind\_textdomain\_codeset

# dgettext

#### **Name**

dgettext — perform lookup in message catalog for the current LC\_MESSAGES
locale

# **Synopsis**

```
#include <libintl.h>
char * dgettext(const char * domainname, const char * msgid);
```

# **Description**

dgettext() is a domain specified version of gettext().

The dgettext() function shall search the currently selected message catalogs in the domain *domainname* for a string identified by the string *msgid*. If a string is located, that string shall be returned. The domain specified by *domainname* applies to the currently active LC\_MESSAGE locale. The default domain shall not be changed by a call to dgettext().

**Note:** The usage of *domainanme* is equivalent in syntax and meaning to the textdomain() function's application of *domainname*, except that the selection of the domain in dgettext() is valid only for the duration of the call.

The dgettext() function is equivalent to dcgettext(domainname, msgid, LC\_MESSAGES).

### **Return Value**

On success of a *msgid* query, the translated NULL-terminated string is returned. On error, the original *msgid* is returned. The length of the string returned is undetermined until dgettext() is called.

#### **Errors**

dgettext() shall not modify the errno global variable.

#### See Also

gettext, dgettext, ngettext, dngettext, dcgettext, dcngettext, textdomain, bindtextdomain, bind\_textdomain\_codeset

# dl\_iterate\_phdr

### **Name**

dl\_iterate\_phdr — iterate over a program's loaded shared objects

# **Synopsis**

```
#include <link.h>
int dl_iterate_phdr(int(*callback) (struct dl_phdr_info *, size_t,
void *), void *data);
```

# **Description**

dl\_iterate\_phdr() allows a program to iterate over the shared objects it has loaded. The function described by the <code>callback</code> parameter is called once for each loaded shared object, allowing an action to be taken for each one. <code>callback</code> is called with three arguments which are filled in by the implementation: a pointer to a structure of type <code>dl\_phdr\_info</code> containing information about the shared object; an integer size of the structure; and a copy of the <code>data</code> argument to <code>dl\_iterate\_phdr()</code>. If <code>callback</code> returns a non-zero value, <code>dl\_iterate\_phdr()</code> will stop processing, even if there are unprocessed shared objects. The order of processing is unspecified.

The dl\_phdr\_info structure has the following members (note that on 64-bit architectures the types here shown as Elf32\_type will instead be Elf64\_type):

```
Elf32_Addr dlpi_addr;
const char *dlpi_name;
const Elf32_Phdr *dlpi_phdr;
Elf32_Half dlpi_phnum;
unsigned long long int dlpi_adds;
unsigned long long int dlpi_subs;
size_t dlpi_tls_modid;
```

```
void *dlpi_tls_data;
```

dlpi\_addr contains the base address of the shared object.

dlpi\_name is a null-terminated string giving the pathname from which the shared object was loaded.

dlpi\_phdr is a pointer to an array of program headers for this shared object, while dlpi\_phnum is the number of entries in this array.

dlpi\_adds and dlpi\_subs are incremented when shared objects are added or removed, respectively.

dlpi\_tls\_modid contains the module ID used in TLS relocations, if there is a PT\_TLS segment. Otherwise the value shall be zero.

dlpi\_tls\_data contains the address of the calling thread's instance of this module's PT\_TLS segment, if there is one and it has been allocated in the calling thread. Otherwise the value shall be a null pointer.

Some implementations may not provide all fields in dl\_phdr\_info, although the first four are always mandatory. Applications are advised to have the callback function check the size parameter before examining the later members.

### **Return Value**

The dl\_iterate\_phdr() function returns whatever value was returned by the last call to *callback*. This will be zero if processing completed normally, since processing does not continue unless the callback function returns zero.

#### **Errors**

No errors are defined by dl\_iterate\_phdr(); as noted the callback function must use a zero return to indicate success but may assign any meaning it wishes to non-zero returns.

### dngettext

### **Name**

dngettext — perform lookup in message catalog for the current locale

# **Synopsis**

```
#include <libintl.h>
char * dngettext(const char * domainname, const char * msgid1, const
char * msgid2, unsigned long int n);
```

# **Description**

```
dngettext() shall be equivalent to a call to
```

```
dcngettext(domainname, msgid1, msgid2, n, LC_MESSAGES)
```

See dcngettext() for more information.

### See Also

gettext, dgettext, ngettext, dcgettext, dcngettext, textdomain, bindtextdomain, bind\_textdomain\_codeset

258

### drand48\_r

### Name

drand48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int drand48_r(struct drand48_data * buffer, double * result);
```

# **Description**

The interface drand48\_r() shall function in the same way as the interface drand48(), except that drand48\_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48\_r(), seed48\_r(), or srand48\_r(), or by filling it with zeroes.

### endutent

### Name

endutent — access utmp file entries

# **Synopsis**

```
#include <utmp.h>
void endutent(void);
```

# **Description**

endutent() closes the utmp file. It should be called when the user code is done accessing the file with the other functions.

# envz\_add, envz\_entry, envz\_get, envz\_merge, envz\_remove, envz\_strip

### **Name**

```
envz_add, envz_entry, envz_get, envz_merge, envz_remove,
envz_strip — Operate on environment vectors
```

# **Synopsis**

```
#include <envz.h>
error_t envz_add(char ** envz, size_t * envz_len, const char * name,
const char * value);
char envz_entry(const char * envz, size_t envz_len, const char *
name);
char envz_get(const char * envz, size_t envz_len, const char *
name);
error_t envz_merge(char ** envz, size_t * envz_len, const char *
envz2, size_t envz2_len, int override);
void envz_remove(char ** envz, size_t * envz_len, const char *
name);
void envz_strip(char ** envz, size_t * envz_len);
```

# **Description**

The envz functions operate on envz vectors, which are typically used to manipulate program environment variables.

An envz vector is identical in makeup to an argz vector (see argz add, argz add sep, argz append, argz count, argz create, argz create sep, argz delete, argz extract, argz insert, argz next, argz replace, argz stringify) but has the constraint that each element is a name, value pair separated by an = character. Only the first = character in an element has special meaning, any subsequent instances are part of the value string. If no = character is present in an element, the value is taken to be NULL. If an element has an empty value (an = character is present), the value will return the empty string "" when queried.

Since an envz vector is an argz vector, the argz functions can be used where it makes sense. For example, converting from a program's environment variables (as described in Chapter 8 of the XBD volume of <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>) to an envz vector is done with argz\_create().

The envz\_add() function adds a string constructed from name and value in the form "name=value" to the envz vector identified by envz and envz\_len, updating envz and envz\_len. If value is NULL it adds a string of the form "name". If an entry with the same name already exists, it is replaced..

The envz\_entry() function searches for name in the envz vector identified by envz and envz\_len, returning the full entry if found, or NULL if not.

The envz\_get() function searches for name in the envz vector identified by envz and envz\_len, returning the value part of the entry if found, or NULL if not. Note the value may be also NULL.

The envz\_merge() function adds each entry from the envz vector identified by envz2 and envz2\_len to the envz vector identified by envz and envz\_len, updating envz and envz\_len. The behavior is as if envz\_add() were called for each entry in envz2. If override is true, then values from envz2 will replace those with the same name in envz.

The envz\_remove() function removes the entry for name from the envz vector identified by envz and envz\_len if it exists, updating envz and envz\_len.

#### LSB Core - Generic 5.0

The envz\_strip() function removes all entries with value NULL.

### **Return Value**

The envz functions that perform memory allocation (envz\_add() and envz\_merge()) return an error\_t type. These functions return 0 on success; if memory allocation fails, they return ENOMEM.

envz\_entry() and envz\_get() return a pointer to a substring in an envz vector, or NULL.

# epoll\_create

#### **Name**

epoll\_create — open an epoll file descriptor

# **Synopsis**

```
#include <sys/epoll.h>
int epoll_create(int size);
```

# **Description**

The epoll API, which consists of the interfaces epoll\_create(), epoll\_ctl(), and epoll\_wait(), shall support all file descriptors compatible with poll(). These interfaces shall be usable in either level-triggered or edge-triggered mode. In level-triggered mode, epoll has similar semantics to poll(), and can be used as a faster replacement for it. In edge-triggered mode, epoll shall only report events for a file descriptor when changes occur on it.

The epoll\_create() interface shall open an epoll file descriptor by allocating an event backing store of approximately size *size*. The *size* parameter is a hint to the kernel about how large the event storage should be, not a rigidly-defined maximum size.

### **Return Value**

On success, epoll\_create() shall return the file descriptor, a non-negative integer that shall be used for subsequent epoll calls. It should be closed with the close() function.

On failure, epoll\_create() shall return -1 and set errno as follows.

### **Errors**

**EINVAL** 

The size parameter is not positive.

**ENFILE** 

The maximum number of open files has been reached by the system.

**ENOMEM** 

Not enough memory to create the kernel object.

#### See Also

```
close(), epoll_ctl(), epoll_wait(), poll().
```

### epoll\_ctl

#### Name

epoll\_ctl — control an epoll file descriptor

# **Synopsis**

```
#include <sys/epoll.h>
int epoll_ctl(int epfd, int op, int fd, struct epoll_event * event);
```

# **Description**

The interface epoll\_ctl() shall control an epoll file descriptor.

The parameter *epfd* shall specify the epoll file descriptor to control.

The parameter *op* shall specify the operation to perform on the specified target file descriptor.

The parameter fd shall specify the target file descriptor on which to perform the specified operation.

The parameter *event* shall specify the object associated with the target file descriptor. The events member of the *event* parameter is a bit set composed of the event types listed below.

# **Event types**

#### **EPOLLERR**

An error condition occurred on the target file descriptor. It shall not be necessary to set this event in events; this interface shall always wait for it.

### **EPOLLET**

This event shall set edge-triggered behavior for the target file descriptor. The default epoll behavior shall be level-triggered.

#### **EPOLLHUP**

A hang up occurred on the target file descriptor. It shall not be necessary to set this event in events; this interface shall always wait for it.

#### **EPOLLIN**

The file is accessible to read() operations.

#### **EPOLLONESHOT**

This event shall set one-shot behavior for the target file descriptor. After epoll\_wait() retrieves an event, the file descriptor shall be disabled and epoll shall not report any other events. To reenable the file descriptor with a new event mask, the user should invoke epoll\_ctl() with EPOLL\_CTL\_MOD in the *op* parameter.

### **EPOLLOUT**

The file is accessible to write() operations.

#### **EPOLLPRI**

Urgent data exists for read() operations.

#### **EPOLLRDHUP**

A stream socket peer closed the connection, or else the peer shut down the writing half of the connection.

# Values of the op parameter

#### EPOLL\_CTL\_ADD

Associate *event* with the file described by *fd*, and add *fd* to the epoll descriptor *epfd*.

#### EPOLL CTL DEL

Remove fd from epfd, and ignore event, which can be NULL.

#### EPOLL\_CTL\_MOD

Change the event event associated with fd.

### **Return Value**

On success, epoll\_ctl() shall return 0.

On failure, epoll\_ctl() shall return -1 and set errno as follows.

### **Errors**

#### **EBADF**

The parameter *epfd* or the parameter *fd* is an invalid file descriptor.

#### **EEXIST**

The parameter *op* was EPOLL\_CTL\_ADD, but the file descriptor *fd* is already in *epfd*.

#### **EINVAL**

The parameter *epfd* is invalid, or it is the same as *fd*, or the operation specified by the parameter *op* is unsupported.

#### **ENOENT**

The parameter *op* was EPOLL\_CTL\_MOD or EPOLL\_CTL\_DEL, but the file descriptor *fd* is not in *epfd*.

#### **ENOMEM**

Not enough memory for the operation specified by the parameter op.

#### EPERM

The file specified by fd does not support epoll.

### See Also

close(), epoll\_create(), epoll\_wait(), poll().

### epoll\_wait

#### **Name**

epoll\_wait — wait for I/O events on an epoll file descriptor

# **Synopsis**

```
#include <sys/epoll.h>
int epoll_wait(int epfd, struct epoll_event * events, int maxevents,
int timeout);
```

# **Description**

The interface epoll\_wait() shall wait for events on the epoll file descriptor specified by the parameter *epfd*.

Upon success, the output parameter *events* shall refer to an area of memory containing epoll\_event structures available to the caller. The data members of these structures shall contain the data set by the user with the interface epoll\_ctl(). The events members shall contain the event bit field that was returned.

The parameter *maxevents* shall specify the maximum number of events that epoll\_wait() may return in the output parameter *events*. The value of this parameter should be greater than 0.

The parameter *timeout* shall specify the maximum number of milliseconds that epoll\_wait() shall wait for events. If the value of this parameter is 0, then epoll\_wait() shall return immediately, even if no events are available, in which case the return code shall be 0. If the value of *timeout* is -1, then epoll\_wait() shall block until either a requested event occurs or the call is interrupted.

### **Return Value**

On success, epoll\_wait() shall return the number of file descriptors that are ready for the I/O that was requested, or else 0 if no descriptors became ready during timeout.

On failure, epoll\_wait() shall return -1 and set errno as follows.

#### **Errors**

#### **EBADF**

The parameter *epfd* is not a valid file descriptor.

#### **EFAULT**

The area of memory referenced by the parameter *events* cannot be accessed with write permissions.

#### **EINTR**

The call was interrupted by a signal handler before the *timeout* expired or any requested event took place.

#### **EINVAL**

The parameter epfd is not a valid epoll file descriptor, or else the parameter maxevents is less than or equal to 0.

#### See Also

```
close(), epoll_ctl(), epoll_create(), poll().
```

### erand48\_r

#### **Name**

erand48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int erand48_r(unsigned short[3] xsubi, struct drand48_data * buffer,
double * result);
```

# **Description**

The interface erand48\_r() shall function in the same way as the interface erand48(), except that erand48\_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48\_r(), seed48\_r(), or srand48\_r(), or by filling it with zeroes.

err

### **Name**

err — display formatted error messages

# **Synopsis**

```
#include <err.h>
void err (int eval , const char * fmt , ...);
```

# **Description**

The err() function shall display a formatted error message on the standard error stream. First, err() shall write the last component of the program name, a colon character, and a space character. If fmt is non-NULL, it shall be used as a format string for the printf() family of functions, and err() shall write the formatted message, a colon character, and a space. Finally, the error message string affiliated with the current value of the global variable errno shall be written, followed by a newline character.

The err() function shall not return, the program shall terminate with the exit value of eval.

#### See Also

error(), errx()

### **Return Value**

None.

#### **Errors**

None.

266

#### error

### Name

error — print error message

# **Synopsis**

```
#include <error.h>
void error (int status , int errnum , const char * format , ...);
```

# **Description**

error() shall print a message to standard error.

error() shall build the message from the following elements in their specified order:

- 1. the program name. If the application has provided a function named error\_print\_progname(), error() shall call this to supply the program name; otherwise, error() uses the content of the global variable program\_name.
- 2. the colon and space characters, then the result of using the printf-style *format* and the optional arguments.
- 3. if *errnum* is nonzero, error() shall add the colon and space characters, then the result of strerror(errnum).
- 4. a newline.

If status is nonzero, error() shall call exit(status).

### See Also

err(), errx()

### errx

### Name

errx — display formatted error message and exit

# **Synopsis**

```
#include <err.h>
void errx (int eval , const char * fmt , ...);
```

# **Description**

The errx() function shall display a formatted error message on the standard error stream. The last component of the program name, a colon character, and a space shall be output. If fmt is non-NULL, it shall be used as the format string for the printf() family of functions, and the formatted error message, a colon character, and a space shall be output. The output shall be followed by a newline character.

errx() does not return, but shall exit with the value of eval.

### **Return Value**

None.

### **Errors**

None.

### See Also

error(), err()

#### fcntl

#### Name

fcntl — file control

# **Description**

fcnt1() is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009</u>), but with differences as listed below.

#### Implementation may set O\_LARGEFILE

According to <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, only an application sets fcnt1() flags, for example O\_LARGEFILE. However, this specification also allows an implementation to set the O\_LARGEFILE flag in the case where the programming environment is one of \_POSIX\_V6\_ILP32\_OFFBIG, \_POSIX\_V6\_LP64\_OFF64, \_POSIX\_V6\_LPBIG\_OFFBIG. See **getconf** and **c99** in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> for a description of these environments. Thus, calling fcnt1() with the *F\_GETFL* command may return O\_LARGEFILE as well as flags explicitly set by the application in the case that both the implementation and the application support an off\_t of at least 64 bits.

### **Additional flags**

In addition to the available values for *cmd*, as documented in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), this specification permits the following constants.

F\_GETSIG shall get the number of the signal to be sent when input or output can occur. If the value is 0, then SIGIO shall be sent. Otherwise, the value retrieved shall be the signal sent, and the signal handler can discover more information when installed with the SA\_SIGINFO flag.

F\_SETSIG shall set the number of the signal to be sent when input or output can occur. If the value is 0, then SIGIO shall be sent. Otherwise, the value set shall be the signal to be sent, and the signal handler can discover more information when installed with the SA\_SIGINFO flag.

F\_GETLK64 is analogous to the F\_GETLK constant in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but shall provide a 64-bit interface on non-64-bit architectures. It is identical to F\_GETLK on a 64-bit machine, but is provided in 64-bit environments for source code consistency among architectures.

F\_SETLK64 is analogous to the F\_SETLK constant in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but shall provide a 64-bit interface on non-64-bit architectures. It is identical to F\_SETLK on a 64-bit machine, but is provided in 64-bit environments for source code consistency among architectures.

F\_SETLKW64 is analogous to the F\_SETLKW constant in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but provides a 64-bit interface on non-64-bit architectures. It is identical to F\_SETLKW on a 64-bit machine, but is provided in 64-bit environments for source code consistency among architectures.

### feof\_unlocked

#### **Name**

feof\_unlocked — non-thread-safe feof

# **Description**

feof\_unlocked() is the same as feof(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

### ferror\_unlocked

### **Name**

ferror\_unlocked — non-thread-safe ferror

# **Description**

ferror\_unlocked() is the same as ferror(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

### fflush\_unlocked

#### **Name**

fflush\_unlocked — non thread safe fflush

# **Description**

fflush\_unlocked() is the same as fflush() except that it need not be thread safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

# fgetc\_unlocked

### **Name**

 $\verb|fgetc_unlocked| -- non-thread-safe fgetc|$ 

# **Description**

fgetc\_unlocked() is the same as fgetc(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

# fgets\_unlocked

#### Name

fgets\_unlocked — non-thread-safe fgets

# **Description**

fgets\_unlocked() is the same as fgets(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

# fgetwc\_unlocked

### **Name**

fgetwc\_unlocked — non thread safe fgetwc

# **Description**

fgetwc\_unlocked() is the same as fgetwc() except that it need not be thread safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

# fgetws\_unlocked

### Name

fgetws\_unlocked — non-thread-safe fgetws

# **Description**

fgetws\_unlocked() is the same as fgetws(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

### fileno\_unlocked

### **Name**

fileno\_unlocked — non-thread-safe fileno

# **Description**

fileno\_unlocked() is the same as fileno(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

### flock

### **Name**

flock — apply or remove an advisory lock on an open file

# **Synopsis**

int flock(int fd, int operation);

# **Description**

flock() applies or removes an advisory lock on the open file fd. Valid operation types are:

#### LOCK\_SH

Shared lock. More than one process may hold a shared lock for a given file at a given time.

#### LOCK\_EX

Exclusive lock. Only one process may hold an exclusive lock for a given file at a given time.

#### LOCK\_UN

Unlock.

#### LOCK\_NB

Don't block when locking. May be specified (by *or*ing) along with one of the other operations.

A single file may not simultaneously have both shared and exclusive locks.

### **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

### **Errors**

#### **EWOULDBLOCK**

The file is locked and the LOCK\_NB flag was selected.

#### **EBADF**

fd is not a not an open file descriptor.

#### **EINTR**

While waiting to acquire a lock, the call was interrupted by delivery of a signal caught by a handler.

#### **EINVAL**

The operation is invalid.

#### **ENOLCK**

The implementation ran out of memory for allocating lock records.

#### **fnmatch**

#### Name

fnmatch — match a filename or a pathname

# **Description**

fnmatch() is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

#### **Additional flags**

In addition to the available values that can be used to form *flags*, as documented in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, this specification permits the following constants.

FNM\_CASEFOLD

If this flag is set, the pattern is matched case-insensitively.

FNM\_FILE\_NAME

A synonym for FNM\_PATHNAME constant specified in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009).

### fputc\_unlocked

### **Name**

fputc\_unlocked — non-thread-safe fputc

# **Description**

fputc\_unlocked() is the same as fputc(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

# fputs\_unlocked

#### **Name**

fputs\_unlocked — non-thread-safe fputs

# **Description**

fputs\_unlocked() is the same as fputs(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

# fputwc\_unlocked

#### **Name**

fputwc\_unlocked — non-thread-safe fputwc

# **Description**

fputwc\_unlocked() is the same as fputwc(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

# fputws\_unlocked

#### **Name**

fputws\_unlocked — non-thread-safe fputws

# **Description**

fputws\_unlocked() is the same as fputws(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

### fread\_unlocked

### **Name**

fread\_unlocked — non-thread-safe fread

# **Description**

fread\_unlocked() is the same as fread(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

#### fscanf

#### **Name**

fscanf — convert formatted input

# **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

#### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

#### **fstatfs**

### **Name**

fstatfs — (deprecated)

# **Synopsis**

```
#include <sys/statfs.h>
int fstatfs(int fd, struct statfs * buf);
```

# **Description**

The fstatfs() function returns information about a mounted file system. The file system is identified by fd, a file descriptor of an open file within the mounted filesystem. The results are placed in the structure pointed to by buf.

Fields that are undefined for a particular file system shall be set to 0.

**Note:** Application developers should use the fstatvfs() function to obtain general file system information. Applications should only use the fstatfs() function if they must determine the file system type, which need not be provided by fstatvfs().

#### **Return Value**

On success, the fstatfs() function shall return 0 and set the fields of the structure idenfitied by *buf* accordingly. On error, the fstatfs() function shall return -1 and set errno accordingly.

### **Errors**

**EBADF** 

fd is not a valid open file descriptor.

**EFAULT** 

buf points to an invalid address.

EIO

An I/O error occurred while reading from or writing to the file system.

**ENOSYS** 

The filesystem fd is open on does not support statfs().

### fstatfs64

### **Name**

fstatfs64 — (deprecated)

# **Synopsis**

```
#include <sys/statfs.h>
int fstatfs64(int fd, struct statfs64 * buf);
```

# **Description**

The fstatfs64() function returns information about a mounted file system. The file system is identified by fd, a file descriptor of an open file within the mounted filesystem. The results are placed in the structure pointed to by buf.

Fields that are undefined for a particular file system shall be set to 0.

fstatfs64() is a large-file version of the fstatfs() function.

**Note:** Application developers should use the fstatvfs64() function to obtain general file system information. Applications should only use the fstatfs64() function if they must determine the file system type, which need not be provided by fstatvfs64().

### **Return Value**

On success, the fstatfs64() function shall return 0 and set the fields of the structure idenfitied by buf accordingly. On error, the fstatfs64() function shall return -1 and set errno accordingly.

### **Errors**

See fstatfs().

#### **futimes**

### **Name**

futimes, lutimes — set file access and modification times

# **Synopsis**

```
#include <sys/time.h>
int futimes(int fd, const struct timeval tv[2]);
int lutimes(const char * filename, const struct timeval tv[2]);
```

# **Description**

The futimes() and lutimes() functions shall set the access and modification times of a file to the values of the tv argument, which is an array of two timeval structures. The behavior is as for utimes() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009</u>).

The futimes() function shall change the times of of the open file described by file descriptor fd.

The lutimes() function shall change the times of of the file pointed to by the filename argument, except that if filename refers to a symbolic link, then the link is not followed and the times of the symbolic link are changed. This is similar to supplying AT\_SYMLINK\_NOFOLLOW in the flag argument to the utimensat() function.

### **Errors**

As for utimes(), but in addition:

**ENOSYS** 

This implementation does not support this function (for lutimes()).

The implementation could not access a resource needed to complete the function (for futimes()).

#### See Also

```
utimes(), utime(), utimensat().
```

### fwrite\_unlocked

#### **Name**

fwrite\_unlocked — non-thread-safe fwrite

# **Description**

fwrite\_unlocked() is the same as fwrite(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

#### **fwscanf**

#### **Name**

fwscanf — convert formatted input

# **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

### getcwd

### **Name**

getcwd — get the pathname of the current working directory

# **Synopsis**

```
#include <unistd.h>
char * getcwd(char * buf, size_t size);
```

# **Description**

The getcwd() functions shall behave as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except as noted below.

### **Differences**

If buf is NULL, memory is allocated for buf. If size is 0, the allocation size will be the size of the pathname +1, else the requested size is allocated.

# **Changed or Added Errors**

**EINVAL** 

The size argument is 0 and buf is not a null pointer.

ENOENT

The current working directory has been unlinked.

# getdomainname

#### Name

getdomainname — get NIS domain name (DEPRECATED).

# **Synopsis**

```
#include <unistd.h>
int getdomainname (char * name , size_t namelen );
```

# **Description**

If the Network Information System (NIS) is in use, getdomainname() shall copy the NIS domain name to the supplied buffer identified by *name*, with maximum length *namelen*. If the NIS domain name is not currently set, getdomainname() shall copy the string "(none)" to the *name*. If *namelen* is less than the length of the string to be copied, getdomainname() shall either truncate the string to *namelen* characters and place it in *name* (without a terminating null character), or shall fail with EINVAL.

**Note:** The NIS domain name is not the same as the domain portion of a fully qualified domain name (for example, in DNS).

The LSB does not include other NIS functions, nor does it specify how NIS may affect other database functions. No conforming application can make use of this information beyond noting whether or not the domain name has been set. If the name is set to a value other than the string "(none)", the application should not imply that NIS is in use. Similarly, if it is set to "(none)", the application should not assume that NIS is not in use, although NIS functionality may be restricted in this case.

### **Return Value**

On success, getdomainname() shall return 0. Otherwise, it shall return -1 and set erron to indicate the error.

### **Errors**

**EINVAL** 

name is a null pointer.

**EINVAL** 

The buffer identified by *name* and *namelen* is of insufficient size to store the NIS domain name string, and the implementation considers this an error.

### **Future Directions**

The LSB does not include other NIS interfaces, and a future version of this specification may remove this interface. Application developers should avoid using this interface where possible.

# getdtablesize

### Name

getdtablesize — get file descriptor table size (DEPRECATED)

# **Synopsis**

```
#include <unistd.h>
int getdtablesize (void );
```

# **Description**

The function getdtablesize() returns the number of files a process can have open.

**Note:** The getdtablesize() function is deprecated. Portable applications should call sysconf() with the \_SC\_OPEN\_MAX option instead.

### **Return Value**

The getdtablesize() function returns the current soft limit as if obtained by a call to sysconf() with the  $_SC_OPEN_MAX$  option.

### **Errors**

No errors are defined.

### getgrent\_r

### **Name**

getgrent\_r — reentrantly get entry in group file

# **Synopsis**

```
#include <grp.h>
int getgrent_r(struct group * gbuf, char * buf, size_t buflen,
struct group * * gbufp);
```

# **Description**

The reentrant interface <code>getgrent\_r()</code> shall function in the same way as the interface <code>getgrent()</code>, except that <code>getgrent\_r()</code> shall return the group name, group password, and group members in buffers provided by the caller, rather than as a pointer to static storage.

The parameter *gbuf* contains the struct group that was read from the stream, if any.

The parameter buf contains additional strings, if any.

The parameter buflen specifies the size of buf.

The parameter \*gbufp returns a pointer to the struct group in \*gbuf.

### **Return Value**

On success, getgrent\_r() shall return 0, and \*gbufp shall contain a pointer to the result.

On failure, \*gbufp shall contain NULL, and getgrent\_r() shall return an error as follows.

### **Errors**

**ENOENT** 

No more group entries.

**ERANGE** 

Not enough buffer space. Specify a larger buffer and try again.

### getgrouplist

#### **Name**

getgrouplist — get groups a user belongs to

# **Synopsis**

```
#include <grp.h>
int getgrouplist(const char * user, gid_t group, gid_t * groups, int
* ngroups);
```

# **Description**

The <code>getgrouplist()</code> function shall fill in the array <code>groups</code> with the supplementary groups for the user specified by <code>user</code>. On entry, <code>ngroups</code> shall refer to an integer containing the maximum number of elements in the <code>groups</code> array. The group <code>group</code> shall also be included in the values returned in <code>groups</code>. It is expected that <code>group</code> would be specified as the user's primary group from the password file (obtainable via <code>getpwnam()</code> or a similar function).

#### **Return Value**

If on entry the value referenced by *ngroups* was greater than or equal to the number of supplementary group identifiers to be copied to the array identified by *groups*, get-grouplist() shall return the number of group identifiers actually copied, and shall set the value referenced by *ngroups* to this value.

If on entry the value referenced by *ngroups* was less than the number of supplementary group identifiers, getgrouplist() shall return -1. The initial *ngroups* entries in *groups* shall be overwritten.

If the number of groups exceeds the input *ngroups* value, then as well as returning -1, *ngroups* shall be set to the number of groups that would have been placed in *groups* if it had been large enough.

**Note:** In such a case, the caller can use the information returned to make a further get-grouplist() call with a correctly sized *groups* array.

If *user* does not refer to a valid user on the system, then the behavior of this function is undefined.

#### **Errors**

None defined.

#### See Also

getgroups()

### gethostbyaddr\_r

### **Name**

gethostbyaddr\_r — find network host database entry matching host name
(DEPRECATED)

# **Synopsis**

```
#include <netdb.h>
int gethostbyaddr_r(const void * restrict addr, socklen_t len, int
type, struct hostent * restrict result_buf, char * restrict buf,
size_t buflen, struct hostent * * restrict result, int * h_errnop);
```

# **Description**

**Note:** The gethostbyaddr\_r() function is deprecated; applications should use getaddrinfo() instead.

gethostbyaddr\_r() is a reentrant version of gethostbyaddr() that searches the network host database for a host address match.

The gethostbyaddr\_r() function shall search the network host database for an entry of address family *type* with the host with address *addr*. The *len* argument contains the length of the address referenced by *addr*.

If type is AF\_INET, the addr argument shall be an in\_addr structure. If type is AF\_INET6, the addr argument shall be an in6\_addr structure. If type is any other value, the behavior is unspecified.

The application must provide a buffer for the gethostbyaddr\_r() to use during the lookup process. The buffer is referenced by buf, and is of size buflen. If the buffer is not of sufficient size, gethostbyaddr\_r() may fail and return ERANGE. If a matching entry is found in the database, gethostbyaddr\_r() shall copy the relevant information to the application supplied hostent structure referenced by result\_buf, and return a pointer to this structure in \*result. If no matching entry is found, \*result shall be set to a null pointer. Additional error information shall be set in the variable referenced by h\_errnop.

#### Return Value

On success, the gethostbyaddr\_r() function shall return zero. If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small. If the gethostbyaddr\_r() function returns returns any other value, then the variable referenced by *h\_errnop* shall be set to indicate the cause as for gethostbyaddr().

# gethostbyname2

### Name

gethostbyname2 — find network host database entry matching host name (DEPRECATED)

# **Synopsis**

int gethostbyname2(const char \* restrict name, int af);

# Description

**Note:** The gethostbyname2() function is deprecated; applications should use getaddrinfo() instead.

The gethostbyname2() function shall search the network host database for an entry with name name. This function is similar to the gethostbyname() function but additionally allows the search to be restricted to a particular address family specified by af.

### **Return Value**

On success, the gethostbyname2() function shall return a pointer to a hostent structure if the requested entry was found, and a null pointer otherwise.

On unsuccessful completion, gethostbyname2() shall set h\_errno as for gethostbyname() in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

### **Errors**

The gethostbyname2() shall set h\_errno as for gethostbyname() in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009).

### gethostbyname2\_r

### **Name**

gethostbyname2\_r — find network host database entry matching host name
(DEPRECATED)

# **Synopsis**

int gethostbyname2\_r(const char \* restrict name, int af, struct
hostent \* restrict result\_buf, char \* restrict buf, size\_t buflen,
struct hostent \*\* restrict result, int \* restrict h\_errnop);

# **Description**

**Note:** The gethostbyname2\_r() function is deprecated; applications should use getaddrinfo() instead.

The gethostbyname2\_r() function shall search the network host database for an entry with name <code>name</code>. gethostbyname2\_r() is a reentrant version of gethostbyname2(). These functions are similar to the <code>gethostbyname()</code> and <code>gethostbyname\_r()</code> functions but additionally allow the search to be restricted to a particular address family specified by af.

The application must provide a buffer for the gethostbyname2\_r() function to use during the lookup process. The buffer is referenced by buf, and is of size buflen. If the buffer is not of sufficient size, gethostbyname\_r() may fail and return ERANGE. If a matching entry is found in the database, gethostbyname\_r() shall copy the relevant information to the application-supplied hostent structure referenced by result\_buf, and return a pointer to this structure in \*result. If no matching entry is found, \*result shall be set to a null pointer. Additional error information shall be set in the variable referenced by h\_errnop.

#### Return Value

On success, the gethostbyname2\_r() function shall return zero. If the return value was ERANGE, the size of the buffer buf, indicated by buflen, was too small. If the gethostbyname2\_r() function returns returns any other value, then the variable referenced by  $h_errnop$  shall be set to indicate the cause as for gethostbyname\_r().

### gethostbyname\_r

#### **Name**

gethostbyname\_r — find network host database entry matching host name
(DEPRECATED)

# **Synopsis**

int gethostbyname\_r(const char \* restrict name, struct hostent \*
restrict result\_buf, char \* restrict buf, size\_t buflen, struct
hostent \*\* restrict result, int \* restrict h\_errnop);

# **Description**

**Note:** The gethostbyname\_r() function is deprecated; applications should use getaddrinfo() instead.

gethostbyname\_r() is a reentrant version of gethostbyname() that searches the network host database for a host name match.

The  $gethostbyname_r()$  function shall search the network host database for an entry with name name.

The application must provide a buffer for the gethostbyname\_r() to use during the lookup process. The buffer is referenced by buf, and is of size buflen. If the buffer is not of sufficient size, gethostbyname\_r() may fail and return ERANGE. If a matching entry is found in the database, gethostbyname\_r() shall copy the relevant information to the application supplied hostent structure referenced by result\_buf, and return a pointer to this structure in \*result. If no matching entry is found, \*result shall be set to a null pointer. Additional error information shall be set in the variable referenced by h\_errnop.

#### **Return Value**

On success, the gethostbyname\_r() function shall return zero. If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small. If the gethostbyname\_r() function returns returns any other value, then the variable referenced by *h\_errnop* shall be set to indicate the cause as for gethostbyname().

# getifaddrs

#### **Name**

 ${\tt getifaddrs,\ free if addrs-} = {\tt get\ interface\ addresses}$ 

# **Synopsis**

```
#include <ifaddrs.h>
int getifaddrs(struct ifaddrs ** ifap);
void freeifaddrs(struct ifaddrs * ifa);
```

# **Description**

The getifaddrs() function creates a linked list of structures describing the network interfaces of the local system. The address of the first item is stored in memory pointed to by ifap. The data returned is dynamically allocated, and should be freed using freeifaddrs().

The list consists of structures of type ifaddrs (see Data Definitions above).

### **Return Value**

On success, getifaddrs() returns zero; on error, -1 is returned, and errno is set appropriately.

### **Errors**

getifaddrs() may fail and set errno for any of the errors specified for socket(), bind(), getsockname(), recvmsg(), sendto(), malloc(), or realloc().

### See Also

```
bind(), getsockname(), socket().
```

# getloadavg

#### **Name**

getloadavg — get system load averages

# **Synopsis**

```
#include <stdlib.h>
int getloadavg(double loadavg[], int nelem);
```

# **Description**

getloadavg() returns the number of processes in the system run queue averaged over various periods of time. Up to *nelem* samples are retrieved and assigned to successive elements of *loadavg*[]. The system imposes a maximum of 3 samples, representing averages over the last 1, 5, and 15 minutes, respectively.

### **Return Value**

If the load average could not be obtained, -1 is returned. Otherwise, the number of samples actually retrieved is returned.

# getopt

### Name

getopt — parse command line options

# **Synopsis**

```
#include <unistd.h>
int getopt(int argc, char * const argv[], const char * optstring);
extern char *optarg;
```

extern int optind, opterr, optopt;

## **Description**

The getopt() function shall parse command line arguments as described in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009), with the following exceptions, where LSB and POSIX specifications vary. LSB systems shall implement the modified behaviors described below.

#### **Argument Ordering**

The getopt() function can process command line arguments referenced by *argv* in one of three ways:

#### **PERMUTE**

the order of arguments in *argv* is altered so that all options (and their arguments) are moved in front of all of the operands. This is the default behavior.

**Note:** This behavior has undefined results if *argv* is not modifiable. This is to support historic behavior predating the use of const and <u>ISO C (1999)</u>. The function prototype was aligned with <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> despite the fact that it modifies *argv*, and the library maintainers are unwilling to change this.

#### REQUIRE\_ORDER

The arguments in *argv* are processed in exactly the order given, and option processing stops when the first non-option argument is reached, or when the element of argv is "--". This ordering can be enforced either by setting the environment variable POSIXLY\_CORRECT, or by setting the first character of *optstring* to '+'.

#### RETURN\_IN\_ORDER

The order of arguments is not altered, and all arguments are processed. Non-option arguments (operands) are handled as if they were the argument to an option with the value 1 ( $\001$ ). This ordering is selected by setting the first character of optstring to '-';

#### Option Characteristics

LSB specifies that:

- an element of argv that starts with "-" (and is not exactly "-" or "--") is an option element.
- characters of an option element, aside from the initial "-", are option characters.

#### POSIX specifies that:

- applications using getopt() shall obey the following syntax guidelines:
  - option name is a single alphanumeric character from the portable character set
  - · option is preceded by the '-' delimiter character
  - options without option-arguments should be accepted when grouped behind one '-'
    delimiter
  - · each option and option-argument is a separate argument
  - · option-arguments are not optional
  - all options should precede operands on the command line
  - the argument "--" is accepted as a delimiter indicating the end of options and the consideration of subsequent arguments, if any, as operands
- historical implementations of getopt() support other characters as options as an allowed extension, but applications that use extensions are not maximally portable.

- support for multi-byte option characters is only possible when such characters can be represented as type int.
- applications that call any utility with a first operand starting with '-' should usually specify "--" to mark the end of the options. Standard utilities that do not support this guideline indicate that fact in the OPTIONS section of the utility description.

#### **Extensions**

LSB specifies that:

- if a character is followed by two colons, the option takes an optional argument; if there is text in the current *argv* element, it is returned in *optarg*, otherwise *optarg* is set to 0.
- if *optstring* contains W followed by a semi-colon (;), then -W foo is treated as the long option -- foo.

**Note:** See getopt\_long() for a description of long options.

- The first character of *optstring* shall modify the behavior of getopt() as follows:
  - if the first character is '+', then REQUIRE\_ORDER processing shall be in effect (see above)
  - if the first character is '-', then RETURN\_IN\_ORDER processing shall be in effect (see above)
  - if the first character is ':', then getopt() shall return ':' instead of '?' to indicate a missing option argument, and shall not print any diagnostic message to stderr.

**POSIX** specifies that:

• the -W option is reserved for implementation extensions.

#### **Return Values**

LSB specifies the following additional getopt() return values:

• '\001' is returned if RETURN\_IN\_ORDER argument ordering is in effect, and the next argument is an operand, not an option. The argument is available in optarg.

Any other return value has the same meaning as for POSIX.

POSIX specifies the following getopt() return values:

- the next option character is returned, if found successfully.
- ':' is returned if a parameter is missing for one of the options and the first character of optstring is ':'.
- '?' is returned if an unknown option character not in optstring is encountered, or if getopt() detects a missing argument and the first character of optstring is not ':'.
- -1 is returned for the end of the option list.

#### **Environment Variables**

LSB specifies that:

- if the variable POSIXLY\_CORRECT is set, option processing stops as soon as a non-option argument is encountered.
- the variable \_[PID]\_GNU\_nonoption\_argv\_flags\_ (where [PID] is the process ID for the current process), contains a space separated list of arguments that should not be treated as arguments even though they appear to be so.

**Rationale:** This was used by bash 2.0 to communicate to *GNU* libc which arguments resulted from wildcard expansion and so should not be considered as options. This behavior was removed in bash version 2.01, but the support remains in *GNU* libc.

This behavior is DEPRECATED in this version of the LSB; future revisions of this specification may not include this requirement.

## getopt\_long

### Name

getopt\_long — parse command line options

# **Synopsis**

```
#define _GNU_SOURCE
#include <getopt.h>
int getopt_long(int argc, char * const argv[], const char * opstring,
const struct option * longopts, int * longindex);
```

# **Description**

getopt\_long() works like getopt() except that it also accepts long options, started out by two dashes. Long option names may be abbreviated if the abbreviation is unique or is an exact match for some defined option. A long option may take a parameter, of the form --arg=param or --arg param.

longopts is a pointer to the first element of an array of struct option declared in getopt.h as:

The fields in this structure have the following meaning:

name

The name of the long option.

has\_arg

One of:

no\_argument (or 0) if the option does not take an argument, required\_argument (or 1) if the option requires an argument, or optional\_argument (or 2) if the option takes an optional argument.

#### flag

specifies how results are returned for a long option. If flag is NULL, then getopt\_long() shall return val. (For example, the calling program may set val to the equivalent short option character.) Otherwise, getopt\_long() returns 0, and flag shall point to a variable which shall be set to val if the option is found, but left unchanged if the option is not found.

va1

The value to return, or to load into the variable pointed to by flag.

If *longindex* is not NULL, it points to a variable which is set to the index of the long option relative to *longopts*.

## **Return Value**

getopt\_long() returns the option character if a short option was found successfully, or ":" if there was a missing parameter for one of the options, or "?" for an unknown option character, or -1 for the end of the option list.

For a long option,  $getopt_long()$  returns val if flag is NULL, and 0 otherwise. Error and -1 returns are the same as for getopt(), plus "?" for an ambiguous match or an extraneous parameter.

# getopt\_long\_only

## **Name**

getopt\_long\_only — parse command line options

# **Synopsis**

#define \_GNU\_SOURCE

#### LSB Core - Generic 5.0

```
#include <getopt.h>
int getopt_long_only(int argc, char * const argv[], const char *
optstring, const struct option * longopts, int * longindex);
```

## **Description**

getopt\_long\_only() is like getopt\_long(), but "-" as well as "--" can indicate a long option. If an option that starts with "-" (not "--") doesn't match a long option, but does match a short option, it is parsed as a short option instead.

**Note:** The getopt\_long\_only() function is intended only for supporting certain programs whose command line syntax was designed before the Utility Syntax Guidelines of <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> were developed. New programs should generally call getopt\_long() instead, which provides the --option syntax for long options, which is preferred by GNU and consistent with <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

## **Return Value**

getopt\_long\_only() returns the option character if the option was found successfully, or ":" if there was a missing parameter for one of the options, or "?" for an unknown option character, or -1 for the end of the option list.

getopt\_long\_only() also returns the option character when a short option is recognized. For a long option, they return val if flag is NULL, and 0 otherwise. Error and -1 returns are the same as for getopt(), plus "?" for an ambiguous match or an extraneous parameter.

# getpagesize

## **Name**

getpagesize — get memory page size (DEPRECATED)

# **Synopsis**

```
#include <unistd.h>
int getpagesize (void );
```

# **Description**

The function getpagesize() returns the number of bytes in a meory page.

**Note:** The getpagesize() function is deprecated. Portable applications should use  $sysconf(\_SC\_PAGE\_SIZE)$  instead.

## **Return Value**

The getpagesize() function returns the current page size.

## **Errors**

No errors are defined.

## getprotobyname\_r

## **Name**

getprotobyname\_r — retrieve information from the network protocol database by protocol name, reentrantly

# **Synopsis**

```
#include <netdb.h>
int getprotobyname_r(const char * name, struct protoent * result_buf,
char * buf, size_t buflen, struct protoent * * result);
```

# **Description**

The  $getprotobyname_r()$  function is a reentrant version of the getprotobyname() function.

The  $getprotobyname_r()$  function shall search the network protocol database for an entry with the name name.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied protoent structure referenced by  $result\_buf$ , and return a pointer to this structure in \*result. If no matching entry is found, \*result shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the protoent structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

## **Return Value**

On success, the getprotobyname\_r() function shall return 0. If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small.

# getprotobynumber\_r

## **Name**

getprotobynumber\_r — retrieve information from the network protocol database by protocol number, reentrantly

# **Synopsis**

```
#include <netdb.h>
int getprotobynumber_r(int proto, struct protoent * result_buf, char
* buf, size_t buflen, struct protoent * * result);
```

## **Description**

The getprotobynumber\_r() function is a reentrant version of the getprotobynumber() function.

The getprotobynumber\_r() function shall search the network protocol database for an entry with protocol number *proto*.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied protoent structure referenced by  $result\_buf$ , and return a pointer to this structure in \*result. If no matching entry is found, \*result shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the protoent structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

## **Return Value**

On success, the <code>getprotobynumber\_r()</code> function shall return 0. If the return value was ERANGE, the size of the buffer <code>buf</code>, indicated by <code>buflen</code>, was too small.

## getprotoent\_r

#### **Name**

getprotoent\_r — read the next entry of the protocol database, reentrantly

# **Synopsis**

```
#include <netdb.h>
int getprotoent_r(struct protoent * result_buf, char * buf, size_t
buflen, struct protoent * * result);
```

# **Description**

The getprotoent\_r() function is a reentrant version of the getprotoent() function.

The getprotoent\_r() function shall search the network protocol database for the next entry.

If the next entry is found in the database, this function shall copy the relevant information to the application-supplied protoent structure referenced by  $result\_buf$ , and return a pointer to this structure in \*result. If no next entry is found, \*result shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the protoent structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

## **Return Value**

On success, the getprotoent\_r() function shall return zero.

If the return value was ENOENT, there were no more entries in the database.

If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small.

## getpwent\_r

## **Name**

getpwent\_r — reentrantly get entry in passwd file

# **Synopsis**

```
#include <pwd.h>
int getpwent_r(struct passwd * pwbuf, char * buf, size_t buflen,
struct passwd * * pwbufp);
```

# **Description**

The reentrant interface getpwent\_r() shall function in the same way as the interface getpwent(), except that getpwent\_r() shall return the user name, user password, GECOS field, home directory, and shell program in buffers provided by the caller, rather than as a pointer to static storage.

The parameter *pwbuf* contains the struct passwd that was read from the stream, if any.

The parameter buf contains additional strings, if any.

The parameter buflen specifies the size of buf.

The parameter \*pwbufp returns a pointer to the struct passwd in \*pwbuf.

## **Return Value**

On success, getpwent\_r() shall return 0, and \*pwbufp shall contain a pointer to the result.

On failure, \*pwbufp shall contain NULL, and getpwent\_r() shall return an error as follows.

## **Errors**

## **ENOENT**

No more password entries.

#### **ERANGE**

Not enough buffer space. Specify a larger buffer and try again.

## getrlimit, setrlimit

#### **Name**

getrlimit, setrlimit — get resource consumption limits

# **Synopsis**

```
#include <sys/resource.h>
int getrlimit(__rlimit_resource_t __resource, struct rlimit *
    _rlimits);
int setrlimit(__rlimit_resource_t __resource, const struct rlimit *
    _rlimits);
```

## **Description**

getrlimit() and setrlimit() are as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009</u>), but with differences as listed below.

#### **Extra Resources**

These additional resources extend the list in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

#### RLIMIT\_NPROC

The maximum number of processes (or, more precisely on Linux, threads) that can be created for the real user ID of the calling process. Upon encountering this limit, fork() shall fail with the error EAGAIN.

#### RLIMIT\_MEMLOCK

The maximum number of bytes of memory that may be locked into RAM. In effect this limit is rounded down to the nearest multiple of the system page size. This limit affects mlock() and mlockall(), the mmap() MAP\_LOCKED operation and the shmctl() SHM\_LOCK operation. The shmctl() SHM\_LOCK locks are accounted for separately from the per-process memory locks established by mlock(), mlockall(), and mmap() MAP\_LOCKED. In the former case, the limit sets a maximum on the total bytes in shared memory segments (see shmget()) that may be locked by the real user ID of the calling process. A process can lock bytes up to this limit in each of these two categories.

## RLIMIT\_LOCKS

A limit on the combined number of flock() locks and fcntl() leases that this process may establish. This limit is obsolete and should not be used; support depends heavily on the version of the operating system kernel.

#### **RLIMIT RSS**

Specifies the limit (in pages) of the process's resident set. This limit is obsolete and should not be used; support depends heavily on the version of the operating system kernel. It affects only calls to madvise() specifying MADV\_WILLNEED.

#### RLIMIT\_SIGPENDING

Specifies the limit on the number of signals that may be queued for the real user ID of the calling process. Both standard and real-time signals are counted for the purpose of checking this limit. However, the limit is enforced only for sigqueue(); it is always possible to use kill() to queue one instance of any of the signals that are not already queued to the process.

#### RLIMIT\_MSGQUEUE

#### LSB Core - Generic 5.0

Specifies the limit on the number of bytes that can be allocated for POSIX message queues for the real user ID of the calling process. This limit is enforced for mq\_open(). Each message queue that the user creates counts (until it is removed) against this limit according to the formula:

where attr is the mq\_attr structure specified as the fourth argument to mq\_open(3).

The first addend in the formula, which includes sizeof(struct msg\_msg \*) (4 bytes on Linux/i386), ensures that the user cannot create an unlimited number of zero-length messages (such messages nevertheless each consume some system memory for bookkeeping overhead).

#### RLIMIT\_NICE

Specifies a ceiling to which the process's nice value can be raised using setpriority() or nice(). The actual ceiling for the nice value is calculated as 20 minus the value of rlim\_cur.

#### RLIMIT RTPRIO

Specifies a ceiling on the real-time priority that may be set for this process using sched\_setscheduler(2) and sched\_setparam(2).

#### RLIMIT\_RTTIME

Specifies a limit (in microseconds) on the amount of CPU time that a process scheduled under a real-time scheduling policy may consume without making a blocking system call. For the purpose of this limit, each time a process makes a blocking system call, the count of its consumed CPU time is reset to zero. The CPU time count is not reset if the process continues trying to use the CPU but is preempted, its time slice expires, or it calls sched\_yield().

Upon reaching the soft limit, the process is sent a SIGXCPU signal. If the process catches or ignores this signal and continues consuming CPU time, then SIGXCPU will be generated once each second until the hard limit is reached, at which point the process is sent a SIGKILL signal.

The intended use of this limit is to stop a runaway real-time process from locking up the system.

#### **Extra Errors**

These additional error codes extend the list in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

#### **EFAULT**

A pointer argument points to a location outside the accessible address space.

## getservbyname\_r

## **Name**

getservbyname\_r — retrieve information from the network services database by service name, reentrantly

# **Synopsis**

```
#include <netdb.h>
int getservbyname_r(const char * name, const char * proto, struct
servent * result_buf, char * buf, size_t buflen, struct servent * result);
```

# **Description**

The getservbyname\_r() function is a reentrant version of the getservbyname() function.

The <code>getservbyname\_r()</code> function shall search the network services database for an entry with the name <code>name</code>. The <code>proto</code> parameter shall restrict the search to entries with the specified protocol. If <code>proto</code> is <code>NULL</code>, <code>getservbyname\_r()</code> may return entries with any protocol.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied servent structure referenced by  $result\_buf$ , and return a pointer to this structure in \*result. If no matching entry is found, \*result shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the servent structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

## **Return Value**

On success, the getservbyname\_r() function shall return zero. If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small.

## getservbyport\_r

## **Name**

getservbyport\_r — retrieve information from the network services database by service port, reentrantly

# **Synopsis**

```
#include <netdb.h>
int getservbyport_r(int port, const char * proto, struct servent *
result_buf, char * buf, size_t buflen, struct servent * * result);
```

## **Description**

The getservbyport\_r() function is a reentrant version of the getservbyport() function.

The <code>getservbyport\_r()</code> function shall search the network services database for an entry with the port <code>port</code>. The <code>proto</code> parameter shall restrict the search to entries with the specified protocol. If <code>proto</code> is <code>NULL</code>, <code>getservbyport\_r()</code> may return entries with any protocol.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied servent structure referenced by  $result\_buf$ , and return a pointer to this structure in \*result. If no matching entry is found, \*result shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the servent structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

## **Return Value**

On success, the getservbyport\_r() function shall return zero. If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small.

## getservent\_r

#### **Name**

getservent\_r — read the next entry of the network services database, reentrantly

# **Synopsis**

```
#include <netdb.h>
int getservent_r(struct servent * result_buf, char * buf, size_t
buflen, struct servent * * result);
```

# **Description**

The getservent\_r() function is a reentrant version of the getservent() function.

The getservent\_r() function shall search the network services database for the next entry.

If the next entry is found in the database, this function shall copy the relevant information to the application-supplied servent structure referenced by  $result\_buf$ , and return a pointer to this structure in \*result. If no next entry is found, \*result shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the servent structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

## **Return Value**

On success, the getservent\_r() function shall return 0.

If the return value was ENOENT, there were no more entries in the database.

If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small.

# getsockopt

#### **Name**

getsockopt — get socket options

# **Synopsis**

#include <sys/socket.h>

#### LSB Core - Generic 5.0

```
#include <netinet/ip.h>
int getsockopt(int socket, int level, int option_name, void *
restrict option_value, socklen_t * restrict option_len);
```

## **Description**

The getsockopt() function shall behave as specified in <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), with the following extensions.

## **IP Protocol Level Options**

If the *level* parameter is IPPROTO\_IP, the following values shall be supported for *option\_name* (see <u>RFC 791:Internet Protocol</u> for further details):

#### **IP\_OPTIONS**

Get the Internet Protocol options sent with every packet from this socket. The *option\_value* shall point to a memory buffer in which the options shall be placed; on entry *option\_len* shall point to an integer value indicating the maximum size of the memory buffer, in bytes. On successful return, the value referenced by *option\_len* shall be updated to the size of data copied to the buffer. For IPv4, the maximum length of options is 40 bytes.

#### IP\_TTL

Get the current unicast Internet Protocol Time To Live value used when sending packets with this socket. The <code>option\_value</code> shall point to a buffer large enough to hold the time to live value (at least 1 byte), and <code>option\_len</code> shall point to an integer value holding the maximum size of that buffer. On successful return, the value referenced by <code>option\_len</code> shall be updated to contain the number of bytes copied into the buffer, which shall be no larger than the initial value, and <code>option\_value</code> shall point to an integer containing the time to live value.

#### IP\_TOS

Get the Internet Protocol type of service indicator used when sending packets with this socket. The <code>option\_value</code> shall point to a buffer large enough to hold the type of service indicator (at least 1 byte), and <code>option\_len</code> shall point to an integer value holding the maximum size of that buffer. On successful return, the value referenced by <code>option\_len</code> shall be updated to contain the number of bytes copied into the buffer, which shall be no larger than the initial value, and <code>option\_value</code> shall point to an integer containing the time to live value.

## gettext

## **Name**

gettext — search message catalogs for a string

# **Synopsis**

```
#include <libintl.h>
char * gettext(const char * msgid);
```

# **Description**

The gettext() function shall search the currently selected message catalogs for a string identified by the string *msgid*. If a string is located, that string shall be returned.

The gettext() function is equivalent to dcgettext(NULL, msgid, LC\_MES-SAGES).

## **Return Value**

If a string is found in the currently selected message catalogs for *msgid*, then a pointer to that string shall be returned. Otherwise, a pointer to *msgid* shall be returned.

Applications shall not modify the string returned by gettext().

#### **Errors**

None.

The gettext() function shall not modify errno.

## See Also

dgettext, ngettext, dngettext, dcngettext, textdomain, bindtextdomain, bind\_textdomain\_codeset

## getutent

#### **Name**

getutent — access user accounting database entries

# **Synopsis**

```
#include <utmp.h>
struct utmp *getutent(void);
```

# **Description**

The getutent() function shall read the next entry from the user accounting database.

#### **Return Value**

Upon successful completion, getutent() shall return a pointer to a utmp structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned. The return value may point to a static area which is overwritten by a subsequent call to getutent().

## **Errors**

None defined.

## getutent\_r

#### **Name**

getutent\_r — access user accounting database entries

# **Synopsis**

```
int getutent_r(struct utmp * buffer, struct utmp ** result);
```

# **Description**

The getutent\_r() function is a reentrant version of the getutent() function. On entry, buffer should point to a user supplied buffer to which the next entry in the database will be copied, and result should point to a location where the result will be stored.

## **Return Value**

On success, getutent\_r() shall return 0 and set the location referenced by *result* to a pointer to *buffer*. Otherwise, getutent\_r() shall return -1 and set the location referenced by *result* to NULL.

## getwc\_unlocked

#### **Name**

getwc\_unlocked — non-thread-safe getwc

# **Description**

getwc\_unlocked() is the same as getwc(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

## getwchar\_unlocked

#### **Name**

getwchar\_unlocked — non-thread-safe getwchar

# **Description**

getwchar\_unlocked() is the same as getwchar(), except that it need not be threadsafe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

## glob64

## **Name**

glob64 — find pathnames matching a pattern (Large File Support)

# **Synopsis**

```
#include <glob.h> int glob64(const char * pattern, int flags, int (*errfunc) (const char *, int), glob64_t * pglob);
```

## **Description**

glob64() is a large-file version of the glob() function defined in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009). It shall search for pathnames matching *pattern* according to the rules used by the shell, /bin/sh. No tilde expansion or parameter substitution is done; see wordexp().

The results of a glob64() call are stored in the structure pointed to by *pglob*, which is a glob64\_t declared in glob.h with the following members:

```
typedef struct
{
    size_t gl_pathc;
    char **gl_pathv;
    size_t gl_offs;
    int gl_flags;
    void (*gl_closedir) (void *);
    struct dirent64 *(*gl_readdir64) (void *);
    void *(*gl_opendir) (const char *);
    int (*gl_lstat) (const char *, struct stat *);
    int (*gl_stat) (const char *, struct stat *);
}
```

#### LSB Core - Generic 5.0

## glob64\_t;

Structure members with the same name as corresponding members of a glob\_t as defined in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> shall have the same purpose.

Other members are defined as follows:

#### gl\_flags

reserved for internal use

#### gl\_closedir

pointer to a function capable of closing a directory opened by gl\_opendir

#### gl\_readdir64

pointer to a function capable of reading entries in a large directory

#### gl\_opendir

pointer to a function capable of opening a large directory

#### gl\_stat

pointer to a function capable of returning file status for a large file

#### gl\_lstat

pointer to a function capable of returning file status information for a large file or symbolic link

A large file or large directory is one with a size which cannot be represented by a variable of type off\_t.

## **Return Value**

On success, 0 is returned. Other possible returns are:

#### GLOB\_NOSPACE

out of memory

#### GLOB\_ABORTED

read error

#### GLOB\_NOMATCH

no match found

## globfree64

#### **Name**

globfree64 — free memory from glob64() (Large File Support)

# **Synopsis**

```
#include <glob.h>
void globfree64(glob64_t * pglob);
```

# **Description**

globfree64() frees the dynamically allocated storage from an earlier call to glob64().

globfree64() is a large-file version of the globfree() function defined in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009).

## gnu\_get\_libc\_version, gnu\_get\_libc\_release

### **Name**

gnu\_get\_libc\_version, gnu\_get\_libc\_release — get glibc-specific
version and release

# **Synopsis**

```
#include <gnu/libc-version.h>
const char * gnu_get_libc_version(void);
const char * gnu_get_libc_release(void);
```

# **Description**

gnu\_get\_libc\_version() returns a string that identifies the version of the C library running the program making the call.

gnu\_get\_libc\_release() returns a string indicates the release status of the C library running the program making the call. This will be a string such as "stable".

#### **Return Value**

The functions return strings. The contents of these strings are unspecified.

## **Errors**

No errors are defined.

#### Notes

These functions are specific to GNU libc (glibc). This specification does not require the implementation of libc to be glibc, although it requires these functions.

The string returned by gnu\_get\_libc\_version() will be a dotted version string, which may have meaning to developers otherwise familiar with glibc. These functions have been requested to aid in portability of software which also runs in non-LSB contexts, but decisions based on the return value should be tempered by an understanding of what the behavioral requirements of this specification are. That is, it may or may not be useful to discover that a running system, for example, has version "2.10.1" if that implies different behavior than described by this specification.

## hcreate\_r

### **Name**

hcreate\_r — allocate space for a hash search table, reentrantly

# **Synopsis**

```
#include <search.h>
int hcreate_r(size_t nel, struct hsearch_data * htab);
```

# **Description**

The hcreate\_r() function is a reentrant version of the hcreate() function.

hcreate\_r() shall initialize the object referenced by *htab* with a hash table containing at least *nel* elements. Unlike its non-reentrant equivalent, hcreate(), the hcreate\_r() function may work with more than one hash table.

The memory for the *htab* object may be dynamically allocated. It must be initialized with 0 before hcreate\_r() is called.

## **Return Value**

On success, hcreate\_r() shall return a non-zero value.

On failure, hcreate\_r() shall return 0. This usually happens because not enough memory was available.

## hdestroy\_r

#### Name

hdestroy\_r — dispose of a hash search table, reentrantly

# **Synopsis**

```
#include <search.h>
void hdestroy_r(struct hsearch_data * htab);
```

# **Description**

The hdestroy\_r() function is a reentrant version of the hdestroy() function.

hdestroy\_r() frees the resources allocated by hcreate\_r() for the object htab.

## hsearch\_r

#### **Name**

hsearch\_r — search a hash table, reentrantly

# **Synopsis**

```
#include <search.h>
int hsearch_r(ENTRY item, ACTION action, ENTRY * * retval, struct
hsearch_data * htab);
```

# **Description**

The hsearch\_r() is a reentrant version of the hsearch() function, but instead of operating on a single global hash table, hsearch\_r() operates on the table described by the object that *htab* references. This object can be initialized with the function hcreate\_r().

Unlike the hsearch() function, hsearch\_r() returns a pointer to the found entry in the variable referred to by retval, rather than directly.

### **Return Value**

On success, hsearch\_r() shall return a non-zero value.

On failure, hsearch\_r() shall return 0 and set errno to an appropriate value.

## **Errors**

#### **ENOMEM**

action was set to ENTER, but the table was full.

**ESRCH** 

action was set to FIND, but no matching element was found in the table.

## inet\_aton

#### Name

inet\_aton — Internet address manipulation routine

# **Synopsis**

```
#include <sys/socket.h>
#include <netinet/in.h>
#include <arpa/inet.h>
int anet_iton(const char * cp, struct in_addr * inp);
```

# **Description**

inet\_aton() converts the Internet host address *cp* from the standard IPv4 numbers-and-dots notation into binary data and stores it in the structure that *inp* points to.

inet\_aton() returns a nonzero value if the address is valid, 0 if not.

**Note:** Note that on some LSB architectures, the host byte order is Least Significant Byte first, whereas the network byte order, as used on the Internet, is Most Significant Byte first.

310

# initgroups

#### **Name**

initgroups — initialize the supplementary group access list

# **Synopsis**

```
#include <grp.h>
#include <sys/types.h>
int initgroups(const char * user, gid_t group);
```

# **Description**

If the process has appropriate privilege, the initgroups() function shall initialize the Supplementary Group IDs for the current process by reading the group database and using all groups of which *user* is a member. The additional group *group* is also added to the list.

## **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

#### **Errors**

**EPERM** 

The calling process does not have sufficient privileges.

**ENOMEM** 

Insufficient memory to allocate group information structure.

#### See Also

setgroups()

## initstate r

#### Name

 $\verb|initstate_r| - \text{reentrantly initialize a state array for random number generator functions}|$ 

# **Synopsis**

```
#include <stdlib.h>
int initstate_r(unsigned int seed, char * statebuf, size_t statelen,
struct random_data * buffer);
```

# **Description**

The interface initstate\_r() shall function in the same way as the interface initstate(), except that initstate\_r() shall use the data in *buffer* instead of the global random number generator state.

# inotify\_add\_watch

#### Name

inotify\_add\_watch — add a watch to a watch list

# **Synopsis**

```
#include <sys/inotify.h>
int inotify_add_watch(int fd, const char * path, uint32_t mask);
```

# **Description**

inotify\_add\_watch() shall add a watch to, or modify an existing watch on, the watch list of the inotify instance specified by the file descriptor fd, for the file specified by path, to monitor the events specified by the bitmask mask. The caller must have read access to the file.

## **Return Value**

On success, inotify\_add\_watch() shall return the unique, non-negative watch descriptor associated with the file *path* and the inotify instance specified by the file descriptor *fd*.

If *path* was already on the watch list, then inotify\_add\_watch() shall return the existing watch descriptor.

If *path* was not already on the watch list, then inotify\_add\_watch() shall allocate a new watch descriptor.

inotify\_add\_watch() shall not work recursively. Monitoring subdirectories of *path* shall require adding watches to them.

On failure, inotify\_add\_watch() shall return -1 and set errno to an appropriate value.

#### **Errors**

#### **EACCESS**

The caller does not have read access to path.

#### EBADF

The file descriptor fd is invalid.

#### **EFAULT**

path is outside of the address space accessible by the process.

#### **EINVAL**

mask contains no legal events, or fd is not a valid inotify file descriptor.

## ENOMEM

There is not enough kernel memory available.

#### **ENOSPC**

The maximum number of watches has been created for this user, or the kernel cannot allocate a resource.

# Application Usage

## Reading

The function read() can be used to determine which inotify events have occurred. A blocking file descriptor will make read() block until at least one event has occurred.

If successful, read() will return at least one of the following inotify\_event structures in a buffer:

```
struct inotify_event {
   int  wd;
   uint32_t mask;
   uint32_t cookie;
   uint32_t len;
   char  path[];
};
```

wd is a watch descriptor that specifies the watch associated with the event. It is obtained from a previous invocation of inotify\_add\_watch().

mask is a bit mask describing inotify events. See the section on masks below.

cookie is an integer associating related inotify events. The integer value is unique, and currently only enables the application to associate IN\_MOVE\_FROM and IN\_MOVE\_TO rename events.

len is a count of the bytes in path, including null bytes. This means that the total length of an inotify\_event structure is

```
sizeof(inotify_event)+len
```

path is only returned when an event occurs for a file within a watched directory. This string is null-terminated, and it may contain more null bytes so that future reads will be aligned properly on an address boundary.

In kernels before 2.6.21, read() returns 0 when the buffer given to it is too small to return data about the next event. In subsequent kernels, it fails with the error EINVAL.

For a given file descriptor, the inotify events are returned in an ordered queue. Events on a file descriptor will always be returned in the correct order of occurrence. If two or more inotify events for a given file descriptor have identical values for all fields, then only one inotify\_event will be returned to represent all of them.

The number of bytes that can be read from an inotify file descriptor can be determined by making a FIONREAD ioctl() call.

#### Masks

The <code>mask</code> argument of <code>inotify\_add\_watch()</code> and the <code>mask</code> field of the <code>inotify\_event</code> structure are bit masks that specify inotify events. The bits in the list below can be set in the <code>mask</code> argument of <code>inotify\_add\_watch()</code> and returned in the <code>mask</code> field of <code>inotify\_event</code>.

#### IN\_ACCESS

File was read.

#### IN\_ALL\_EVENTS

Bit mask of all events in this list.

#### IN ATTRIB

File's metadata changed (including timestamps and permissions).

#### IN CLOSE

Same as

IN\_CLOSE\_WRITE | IN\_CLOSE\_NOWRITE

#### LSB Core - Generic 5.0

## IN\_CLOSE\_WRITE

File that was opened for writing was closed.

## IN\_CLOSE\_NOWRITE

File that was not opened for writing was closed.

## IN\_CREATE

File or directory was created in a watched directory.

## IN\_DELETE

File or directory was deleted in a watched directory.

## IN\_DELETE\_SELF

Watched file or directory was deleted.

## IN\_MODIFY

File was changed.

## IN\_MOVE

Same as

IN\_MOVED\_FROM | IN\_MOVED\_TO

#### IN\_MOVE\_SELF

Watched file or directory was moved

#### IN\_MOVED\_FROM

File was moved out of watched directory.

#### IN\_MOVED\_TO

File was moved into watched directory.

#### IN\_OPEN

File was opened.

All of the events above, except for IN\_DELETE\_SELF and IN\_MOVE\_SELF, cause the name field of the inotify\_event structure to contain the name of the file or directory being monitored.

The following bit is valid for inotify\_add\_watch() only.

#### IN\_ONESHOT

Monitor path for an event, and then remove it from the watch list.

The following bits are valid for the inotify\_event structure only.

#### IN IGNORED

Watch was removed, either explicitly (via inotify\_rm\_watch()) or implicitly (file deletion or file system unmounting).

### IN\_ISDIR

Object being watched is a directory.

#### IN Q OVERFLOW

The event queue overflowed (wd is set to -1).

#### IN\_UNMOUNT

File system of object being watched was unmounted.

#### **Notes**

It is possible to monitor file descriptors with the functions epoll(), poll(), and select().

When all of the file descriptors that point to an inotify instance have been closed, the instance and its associated resources and watches are freed by the kernel.

## See Also

inotify\_init(), inotify\_rm\_watch()

# inotify\_init

## **Name**

inotify\_init — instantiate inotify

# **Synopsis**

```
#include <sys/inotify.h>
int inotify_init(void);
```

# **Description**

inotify\_init() shall create one instance of inotify.

## **Return Value**

On success, inotify\_init() shall return a file descriptor pointing to the new inotify instance.

On failure, inotify\_init() shall return -1 and set errno to an appropriate value.

## **Errors**

#### **EMFILE**

The maximum number of inotify instances has been created for this user.

#### **ENFILE**

The maximum number of file descriptors has been created on the system.

## **ENOMEM**

There is not enough kernel memory available.

## See Also

inotify\_add\_watch(), inotify\_rm\_watch()

# inotify\_rm\_watch

## Name

inotify\_rm\_watch — remove a watch from an inotify watch list

# **Synopsis**

```
#include <sys/inotify.h>
int inotify_rm_watch(int fd, int wd);
```

# **Description**

inotify\_rm\_watch() shall remove the watch associated with the watch descriptor *wd* from the watch list of the inotify instance associated with the file descriptor *fd*.

If a watch is removed, its watch descriptor shall generate the IN\_IGNORED event.

## **Return Value**

On success, inotify\_rm\_watch() shall return 0.

On failure, inotify\_rm\_watch() shall return -1 and set errno to an appropriate value.

## **Errors**

**EBADF** 

The file descriptor *fd* is invalid.

**EINVAL** 

wd is invalid, or fd is not a valid inotify file descriptor.

## See Also

inotify\_add\_watch(), inotify\_init()

#### ioctl

#### Name

ioctl — control device

# **Synopsis**

```
#include <sys/ioctl.h>
int ioctl (int fildes , int request , ...);
```

# **Description**

The ioctl() function shall manipulate the underlying device parameters of special files. *fildes* shall be an open file descriptor referring to a special file. The ioctl() function shall take three parameters; the type and value of the third parameter is dependent on the device and *request*.

Conforming LSB applications shall not call ioctl() except in situations explicitly stated in this specification.

## **Return Value**

On success, 0 is returned. An ioctl() may use the return value as an output parameter and return a non-negative value on success. On error, -1 is returned and the global variable errno is set appropriately.

## **Errors**

**EBADF** 

fildes is not a valid descriptor.

**EFAULT** 

The third parameter references an inaccessible memory area.

ENOTTY

fildes is not associated with a character special device.

**ENOTTY** 

The specified request does not apply to the kind of object that *fildes* references.

**EINVAL** 

request or the third parameter is not valid.

# **Relationship to POSIX (Informative)**

It should be noted that <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> contains an interface named ioctl(). The LSB only defines behavior when *fildes* refers to a socket (see <u>sockio</u>) or terminal device (see <u>ttyio</u>), while <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> only defines behavior when *fildes* refers to a STREAMS device. An implementation may support both behaviors; the LSB does not require any STREAMS support.

## sockio

## **Name**

sockio — socket ioctl commands

# **Synopsis**

#include <sys/ioctl.h>
#include <sys/socket.h>
#include <net/if.h>

```
#include <netinet/in.h>
int ioctl(int sockfd, int request, void * argp);
```

## **Description**

Socket ioctl() commands are a subset of the ioctl() calls, which can perform a variety of functions on sockets. *sockfd* shall be an open file descriptor referring to a socket (see the socket() or accept() functions).

Socket ioctl() commands apply to the underlying network interfaces, and affect the entire system, not just the file descriptor used to issue the ioctl().

The following values for *request* are accepted:

#### SIOCGIFCONF (Deprecated)

Get the interface configuration list for the system.

**Note:** The SIOCGIFCONF interface is superceded by the if\_nameindex() family of functions (see <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>). A future version of this specification may withdraw this value for *request*.

argp shall point to a ifconf structure, as described in <net/if.h>. Before calling, the caller shall set the *ifc\_ifcu\_ifcu\_req* field to point to an array of ifreq structures, and set *ifc\_len* to the size in bytes of this allocated array. Upon return, *ifc\_len* will contain the size in bytes of the array which was actually used. If it is the same as the length upon calling, the caller should assume that the array was too small and try again with a larger array.

On success, SIOCGIFCONF shall return a nonnegative value.

Rationale: Historical UNIX systems disagree on the meaning of the return value.

#### **SIOCGIFFLAGS**

Get the interface flags for the indicated interface. argp shall point to a ifreq structure. Before calling, the caller should fill in the *ifr\_name* field with the interface name, and upon return, the *ifr\_ifru.ifru\_flags* field is set with the interface flags.

### SIOCGIFADDR

Get the interface address for the given interface. argp shall point to a ifreq structure. Before calling, the caller should fill in the *ifr\_name* field with the interface name, and upon return, the *ifr\_ifru.ifru\_addr* field is set with the interface address.

#### SIOCGIFBRDADDR

Get the interface broadcast address for the given interface. *argp* shall point to a ifreq structure. Before calling, the caller should fill in the *ifr\_name* field with the interface name, and upon return, the *ifr\_ifru.ifru\_broadcast* field is set with the interface broadcast address.

#### SIOCGIFDSTADDR

Get the point-to-point address for the given interface. argp shall point to a ifreq structure. Before calling, the caller should fill in the *ifr\_name* field with the interface name, and upon return, the *ifr\_dstaddr* field is set with the point-to-point address.

#### SIOCGIFNAME

Get the name of an interface. *argp* shall point to a ifreq structure. Before calling, the caller should fill in the *ifr\_ifindex* field with the number (index) of the interface, and upon return, the *ifr\_name* field is set with the interface name.

#### **SIOCGIFNETMASK**

Get the network mask for the given interface. *argp* shall point to a ifreq structure. Before calling, the caller should fill in the *ifr\_name* field with the interface name, and upon return, the *ifr\_ifru\_ifru\_netmask* field is set with the network mask.

#### SIOCGIFMTU

Get the Maximum Transmission Unit (MTU) size for the given interface. argp shall point to a ifreq structure. Before calling, the caller should fill in the ifr\_name field with the interface name, and upon return, the ifr\_ifru.ifru\_mtu field is set with the MTU. Note: The range of valid values for MTU varies for an interface depending on the interface type.

#### FIONREAD

Get the amount of queued unread data in the receive buffer. *argp* shall point to an integer where the result is to be placed.

**Note:** Some implementations may also support the use of FIONREAD on other types of file descriptor. However, the LSB only specifies its behavior for a socket related file descriptor.

## **Return Value**

On success, if *request* is SIOCGIFCONF, a non-negative integer shall be returned. If request is not SIOCGIFCONF, on success 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

### **Errors**

#### **EBADF**

sockfd is not a valid descriptor.

#### **EFAULT**

argp references an inaccessible memory area.

#### **ENOTTY**

The specified *request* does not apply to the kind of object that the descriptor *sockfd* references.

#### **EINVAL**

Either request or argp is invalid.

#### **ENOTCONN**

The operation is only defined on a connected socket, but the socket wasn't connected.

## ttyio

#### Name

ttyio — tty ioctl commands

# **Synopsis**

```
#include <sys/ioctl.h>
#include <fcntl.h>
int ioctl(int fd, unsigned long request, int * argp);
```

# **Description**

Tty *ioctl* commands are a subset of the ioctl() calls, which can perform a variety of functions on tty devices. *fd* shall be an open file descriptor referring to a terminal device.

The following ioctl()s are provided:

#### **TIOCGWINSZ**

Get the size attributes of the terminal or pseudo-terminal identified by *fd*. On entry, *argp* shall reference a winsize structure. On return, the structure will have *ws\_row* set to the number of rows of text (i.e. lines of text) that can be viewed on the device, and *ws\_col* set to the number of columns (i.e. text width).

**Note:** The number of columns stored in *ws\_col* assumes that the terminal device is using a mono-spaced font.

#### **TIOCSWINSZ**

Sets the size attributes of the terminal or pseudo-terminal identified by fd. On entry, argp shall reference a winsize structure. The value of the winsize structure's element ws\_row shall be the number of rows of text (i.e. lines of text) that can be viewed on the device, and the element ws\_col shall be the number of columns (i.e. text width). Note that this call merely sets the size attributes for the kernel driver, not the window size itself, and is intended to be used to update the kernel driver when the window size is changed.

## **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

## **Errors**

**EBADF** 

fd is not a valid descriptor.

**EFAULT** 

argp references an inaccessible memory area.

**EINVAL** 

request and argp are not valid.

# jrand48\_r

## **Name**

jrand48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int jrand48_r(unsigned short[3] xsubi, struct drand48_data * buffer,
long int * result);
```

# **Description**

The interface jrand48\_r() shall function in the same way as the interface jrand48(), except that jrand48\_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48\_r(), seed48\_r(), or srand48\_r(), or by filling it with zeroes.

#### kill

#### **Name**

kill — send a signal

# **Synopsis**

```
#include <signal.h>
int kill(pid_t pid, int sig);
```

# **Description**

kill() is as specified in the <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

#### Process ID -1 doesn't affect calling process

If *pid* is specified as -1, *sig* shall not be sent to the calling process. Other than this, the rules in the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)* apply.

**Rationale:** This was a deliberate Linus decision after an unpopular experiment in including the calling process in the 2.5.1 kernel. See "What does it mean to signal everybody?", Linux Weekly News, 20 December 2001, http://lwn.net/2001/1220/kernel.php3

## lcong48\_r

#### **Name**

lcong48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int lcong48_r(unsigned short[7] param, struct drand48_data *
buffer);
```

## **Description**

The interface lcong48\_r() shall function in the same way as the interface lcong48(), except that lcong48\_r() shall use the data in *buffer* instead of the global random number generator state.

#### link

#### Name

link — create a link to a file

# **Synopsis**

```
#include <unistd.h>
int link(const char * path1, const char * path2);
```

# **Description**

The link() function shall behave as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except with differences as listed below.

#### **Need Not Follow Symlinks**

POSIX 1003.1-2008 (ISO/IEC 9945-2009) specifies that pathname resolution shall follow symbolic links during pathname resolution unless the function is required to act on the symbolic link itself, or certain arguments direct that the function act on the symbolic link itself. The link() function in POSIX 1003.1-2008 (ISO/IEC 9945-2009) contains no such requirement to operate on a symbolic link. However, a conforming LSB implementation need not follow a symbolic link for the path1 argument.

## Irand48\_r

#### **Name**

1rand48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int lrand48_r(struct drand48_data * buffer, long int * result);
```

# **Description**

The interface lrand48\_r() shall function in the same way as the interface lrand48(), except that lrand48\_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48\_r(), seed48\_r(), or srand48\_r(), or by filling it with zeroes.

#### memmem

### **Name**

memmem — locate bytes

# **Synopsis**

```
#define _GNU_SOURCE
#include <string.h>
void * memmem(const void * haystack, Size_t haystacklen, Const void *
needle, Size_t needlelen);
```

# **Description**

memmem() finds the start of the first occurrence of the byte array referenced by *needle* of length *needlelen* in the memory area *haystack* of length *haystacklen*.

## **Return Value**

If needle is found, memmem() returns a pointer to it. If needlelen is 0, memmem returns haystack. If needle is not found in haystack, memmem() returns NULL.

#### **Notes**

Earlier versions of the C library (prior to glibc 2.1) contained a memmem() with various problems, and application developers should treat this function with care.

### memrchr

### Name

memrchr — scan memory for a character

# **Synopsis**

```
#include <string.h>
void * memrchr(const void * s, int c, size_t n);
```

# **Description**

The memrchr() function shall locate the last occurrence of c (converted to an unsigned char) in the initial n bytes (each interpreted as an unsigned char) of the object pointed to by s.

## **Return Value**

The memrchr() shall return a pointer to the located byte, or a null pointer if the byte does not occur in the object.

## **Errors**

No errors are defined.

## See Also

memchr()

# mkstemp64

## Name

mkstemp64 — create a unique temporary file (Large File Support)

# **Synopsis**

#include <stdio.h>

```
#include <stdlib.h>
int mkstemp64(char * template);
```

# **Description**

mkstemp64() shall generates a unique temporary file name from *template*. The last six characters of template shall be XXXXXX and these are replaced with a string that makes the file name unique; the file is then created and an open file descriptor returned as described for mkstemp().

mkstemp64() is a large-file version of the mkstemp() function as defined in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009). The only difference is that the temporary file is opened with open64() instead of with open().

## **Return Value**

On success, mkstemp64() returns the file descriptor of the temporary file. Otherwise mkstemp64() shall return -1 and set errno to indicate the error.

## **Errors**

See mkstemp() for possible error values.

## mrand48\_r

#### Name

mrand48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int mrand48_r(struct drand48_data * buffer, long int * result);
```

# **Description**

The interface mrand48\_r() shall function in the same way as the interface mrand48(), except that mrand48\_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48\_r(), seed48\_r(), or srand48\_r(), or by filling it with zeroes.

#### mremap

#### **Name**

mremap — remap a virtual memory address

# **Synopsis**

```
#include <sys/mman.h>
void * mremap(void * old_address, size_t old_size, size_t new_size,
int flags);
```

## **Description**

The mremap() function expands (or shrinks) an existing memory mapping, potentially moving it at the same time, depending on the flags argument and the available virtual address space.

old\_address is the old address of the virtual memory block to be resized. Note that old\_address must be page aligned. old\_size is the old size of the virtual memory block. new\_size is the requested size of the virtual memory block after the resize.

In Linux the memory is divided into pages. A user process has (one or) several linear virtual memory segments. Each virtual memory segment has one or more mappings to real memory pages (in the page table). Each virtual memory segment has its own protection (access rights), which may cause a segmentation violation if the memory is accessed incorrectly (e.g., writing to a read-only segment). Accessing virtual memory outside of the segments will also cause a segmentation violation.

mremap() uses the Linux page table scheme. mremap() changes the mapping between virtual addresses and memory pages. This can be used to implement a very efficient form of realloc().

The flags bit-mask argument may be 0, or include the following flag:

#### MREMAP\_MAYMOVE

By default, if there is not sufficient space to expand a mapping at its current location, then mremap() fails. If this flag is specified, then the kernel is permitted to relocate the mapping to a new virtual address, if necessary. If the mapping is relocated, then absolute pointers into the old mapping location become invalid (offsets relative to the starting address of the mapping should be employed).

#### MREMAP FIXED

This flag serves a similar purpose to the MAP\_FIXED flag of mmap(). If this flag is specified, then mremap() accepts a fifth argument, void \*new\_address, which specifies a pagealigned address to which the mapping must be moved. Any previous mapping at the address range specified by new\_address and new\_size is unmapped. If MREMAP\_FIXED is specified, then MREMAP\_MAYMOVE must also be specified.

If the memory segment specified by old\_address and old\_size is locked (using mlock() or similar), then this lock is maintained when the segment is resized and/or relocated. As a consequence, the amount of memory locked by the process may change.

### **Return Value**

The mremap() function returns a pointer to the new virtual memory area on success. On error, the value MAP\_FAILED is returned, and erron is set appropriately.

#### **Errors**

#### **EAGAIN**

The caller tried to expand a memory segment that is locked, but this was not possible without exceeding the RLIMIT\_MEMLOCK resource limit.

#### **EFAULT**

"Segmentation fault." Some address in the range old\_address to old\_address+old\_size is an invalid virtual memory address for this process. You can also get EFAULT even if there exist mappings that cover the whole address space requested, but those mappings are of different types.

#### **EINVAL**

An invalid argument was given. Possible causes are: old\_address was not page aligned; a value other than MREMAP\_MAYMOVE or MREMAP\_FIXED was specified in flags; new\_size was zero; new\_size or new\_address was invalid; or the new address range specified by new\_address and new\_size overlapped the old address range specified by old\_address and old\_size; or MREMAP\_FIXED was specified without also specifying MREMAP\_MAYMOVE.

#### **ENOMEM**

The memory area cannot be expanded at the current virtual address, and the MREMAP\_MAYMOVE flag is not set in flags, or, there is not enough (virtual) memory available.

## ngettext

#### **Name**

ngettext — search message catalogs for plural string

# **Synopsis**

```
#include <libintl.h>
char * ngettext(const char * msgid1, const char * msgid2, unsigned
long int n);
```

## **Description**

The ngettext() function shall search the currently selected message catalogs for a string matching the singular string msgid1. If a string is located, and if n is 1, that string shall be returned. If n is not 1, a pluralized version (dependent on n) of the string shall be returned.

The ngettext() function is equivalent to dcngettext(NULL, msgid1, msgid2, n, LC\_MESSAGES)().

## **Return Value**

If a string is found in the currently selected message catalogs for msgid1, then if n is 1 a pointer to the located string shall be returned. If n is not 1, a pointer to an appropriately pluralized version of the string shall be returned. If no message could be found in the currently selected mesage catalogs, then if n is 1, a pointer to msgid1 shall be returned, otherwise a pointer to msgid2 shall be returned.

Applications shall not modify the string returned by ngettext().

#### **Errors**

None.

The ngettext() function shall not modify errno.

## See Also

gettext, dgettext, ngettext, drgettext, dcngettext, textdomain, bindtextdomain, bind\_textdomain\_codeset

## nrand48\_r

#### **Name**

nrand48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int nrand48_r(unsigned short[3] xsubi, struct drand48_data * buffer,
long int * result);
```

# **Description**

The interface nrand48\_r() shall function in the same way as the interface nrand48(), except that nrand48\_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48\_r(), seed48\_r(), or srand48\_r(), or by filling it with zeroes.

## openat64

#### **Name**

openat64 — open a file relative to a directory file descriptor (Large File Support)

# **Synopsis**

```
#include <fcntl.h>
int openat64(int fd, const char * path, int oflag, ...);
```

# **Description**

openat64() shall establish a connection between a file and a file descriptor. It shall be identical open64() except in the case where *path* specifies a relative path. In this case, the file to be opened shall be determined relative to the directory associated with the file descriptor *fd* instead of the current working directory.

openat64() is a large-file version of the openat() function as defined in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009</u>). It differs from openat() in the same way that open64() differs from open(), that the open is done in large-file mode.

#### **Return Value**

On success, openat64() returns a new file descriptor. Otherwise openat64() shall return -1 and set errno to indicate the error.

### **Errors**

See openat () for possible error values.

## pmap\_getport

#### **Name**

pmap\_getport — find the port number assigned to a service registered with a portmapper.

# **Synopsis**

```
#include <rpc/pmap_clnt.h>
u_short * pmap_getport(struct sockaddr_in * address, const u_long
program, const u_long * version, u_int protocol);
```

# **Description**

The pmap\_getport() function shall return the port number assigned to a service registered with a RPC Binding service running on a given target system, using the protocol described in RFC 1833: Binding Protocols for ONC RPC Version 2. The pmap\_getport() function shall be called given the RPC program number program, the program version version, and transport protocol protocol. Conforming implementations shall support both IPPROTO\_UDP and IPPROTO\_TCP protocols. On entry, address shall specify the address of the system on which the portmapper to be contacted resides. The value of address->sin\_port shall be ignored, and the standard value for the portmapper port shall always be used.

**Note:** Security and network restrictions may prevent a conforming application from contacting a remote RPC Binding Service.

## **Return Value**

On success, the pmap\_getport() function shall return the port number in host byte order of the RPC application registered with the remote portmapper. On failure, if either the program was not registered or the remote portmapper service could not be reached, the pmap\_getport() function shall return 0. If the remote portmap service could not be reached, the status is left in the global variable rpc\_createerr.

#### pmap\_set

### **Name**

pmap\_set — establishes mapping to machine's RPC Bind service.

# **Synopsis**

```
#include <rpc/pmap_clnt.h>
bool_t pmap_set(const u_long program, const u_long version, int
protocol, u_short port);
```

# **Description**

pmap\_set() establishes a mapping between the triple [program, version, protocol] and port on the machine's RPC Bind service. The value of protocol is most likely IPPROTO\_UDP or IPPROTO\_TCP. Automatically done by svc\_register().

#### Return Value

 ${\tt pmap\_set}$  ( ) returns non-zero if it suceeds, 0 otherwise.

### pmap\_unset

#### **Name**

pmap\_unset — destroys RPC Binding

# **Synopsis**

```
#include <rpc/pmap_clnt.h>
bool_t pmap_unset(u_long prognum, u_long versnum);
```

# Description

As a user interface to the RPC Bind service, pmap\_unset() destroys all mapping between the triple [prognum,versnum, \*] and ports on the machine's RPC Bind service.

### **Return Value**

pmap\_unset() returns non-zero if it succeeds, zero otherwise.

## posix\_fadvise64

#### **Name**

posix\_fadvise64 — File advisory information (Large File Support)

# **Synopsis**

```
#include <fcntl.h>
int posix_fadvise64(int fd, off64_t offset, off64_t len, int advice);
```

# **Description**

The posix\_fadvise64() function is a large-file version of the posix\_fadvise() function defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It shall advise the implementation on the expected behavior of the application with respect to the data in the file associated with the open file descriptor, fd, starting at offset and continuing for len bytes. The specified range need not currently exist in the file. If len is zero, all data following offset is specified. The implementation may use this information to optimize handling of the specified data. The posix\_fadvise() function shall have no effect on the semantics of other operations on the specified data, although it may affect the performance of other operations.

The advice to be applied to the data is specified by the *advice* parameter, as specified in posix\_fadvise().

#### **Return Value**

On success, posix\_fadvise64() shall return 0. Otherwise an error number shall be returned to indicate the error. See posix\_fadvise() for possible error values.

## posix\_fallocate64

#### **Name**

posix\_fallocate64 — file space control (Large File Support)

# **Synopsis**

```
#include <fcntl.h>
int posix_fallocate64(int fd, off64_t offset, off64_t len);
```

## **Description**

The posix\_fallocate64() function is a large file version of posix\_fallocate(). It shall behave as posix\_fallocate() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that the *offset* and *len* arguments are off64\_t objects rather than off\_t.

#### **Return Value**

See posix\_fallocate().

#### **Errors**

See posix\_fallocate().

## pread64

### **Name**

pread64 — read from a file (Large File Support)

# **Synopsis**

```
#include <unistd.h>
ssize_t pread64(int fd, Void * buf, size_t count, Off64_t offset);
```

# **Description**

pread64() shall read *count* bytes into *buf* from the file associated with the open file descriptor *fd*, at the position specified by *offset*, without changing the file position.

pread64() is a large-file version of the pread() function as defined in  $\underline{POSIX}$   $\underline{1003.1\text{-}2008}$  (ISO/IEC 9945-2009). It differs from pread() in that the *offset* parameter is an off64 t instead of an off t

### **Return Value**

On success, pread64() shall return the number of bytes actually read. Otherwise pread64() shall return -1 and set errno to indicate the error.

### **Errors**

See pread() for possible error values.

## ptrace

#### **Name**

ptrace — process trace

# **Synopsis**

```
#include <sys/ptrace.h>
long ptrace(enum __ptrace_request request, pid_t pid, void * addr,
void * data);
```

## **Description**

The ptrace() system call shall enable a process to observe and control the execution of another process, as well as examine and change certain attributes of that process.

This function operates via requests, which act on the traced process using the other parameters in ways unique to each request type. The tracing process must initiate tracing, either via the PTRACE\_TRACEME or PTRACE\_ATTACH requests, before other requests may be performed. Except for PTRACE\_TRACEME and PTRACE\_KILL, all requests must be performed on a traced process that has been stopped.

All signals, except one, delivered to the traced process cause it to stop, irrespective of its registered signal handling, and cause an event to be delivered to the tracing process which can be detected using the wait(2) system call. The exception is the SIGKILL signal, which is delivered immediately and performs its usual specified behavior.

The following requests are defined:

#### PTRACE\_TRACEME

This request initates a trace from the perspective of the traced process, indicating that the parent of the current process shall be the tracing process. When this is called, a subsequent call to execve(2) shall cause the tracing process to receive a SIGTRAP signal, and shall stop the current process. This is the only request a traced process may perform, and a tracing process may not perform this request. The other parameters are ignored.

#### PTRACE\_ATTACH

This request initates a trace from the perspective of the tracing process on the process specified by *pid*. After this call succeeds, the traced process will appear to be a child of the tracing process, although the original parent will still be returned to the traced process via getppid(2). The traced process will receive a SIGSTOP signal; the tracing process should use wait(2) to ensure that the traced process has stopped. A tracing process is only guaranteed to be able to trace its child processes; the tracing of other processes may not be allowed by the system, and the process with process ID 1 may not be traced under any circumstances. The *addr* and *data* parameters are ignored.

#### PTRACE\_CONT

This request restarts a traced process, given in *pid*, which has been stopped. The *data* parameter may point to a signal ID to deliver to the traced process; if it is zero or SIGSTOP, no signal is delivered to the child. The *addr* is ignored.

#### PTRACE\_DETACH

This request performs the same function, in the same way, as PTRACE\_CONT, except that the tracing relationship between the tracing and traced processes is also undone. If the trace was initiated using PTRACE\_ATTACH, the original parent-child relationships that existed beforehand are restored.

#### LSB Core - Generic 5.0

#### PTRACE\_KILL

This request causes a SIGKILL signal to be sent to the traced process specified in *pid*. The *addr* and *data* parameters are ignored.

#### PTRACE\_PEEKTEXT

This request reads a word at the location *addr* of the traced process *pid*, and returns it to the caller. The *data* parameter is ignored.

#### PTRACE PEEKDATA

This request performs identically to the PTRACE\_PEEKTEXT request.

#### PTRACE\_PEEKUSER

This request reads a word at offset addr in the USER area of the traced process pid. The offset must be word-aligned. The data parameter is ignored.

#### PTRACE POKETEXT

This request writes the word pointed at by *data* to the location *addr* of the traced process *pid*.

#### PTRACE\_POKEDATA

This request performs identically to the PTRACE\_POKETEXT request.

#### PTRACE\_POKEUSER

This request writes the word pointed at by *data* to offset *addr* in the USER area of the traced process *pid*. The offset must be word-aligned. Implementations may choose to disallow some modifications to the USER area.

#### PTRACE\_GETREGS

This request copies the general purpose registers from the traced process *pid* to the tracing process at location *data*. This parameter may not be available on all architectures. The *addr* parameter is ignored.

#### PTRACE\_GETFPREGS

This request copies the floating point registers from the traced process *pid* to the tracing process at location *data*. This parameter may not be available on all architectures. The *addr* parameter is ignored.

#### PTRACE\_SETREGS

This request writes the general purpose registers to the traced process *pid* from the tracing process at location *data*. This parameter may not be available on all architectures. Implementations may choose to disallow some register modifications. The *addr* parameter is ignored.

### PTRACE\_SETFPREGS

This request writes the floating point registers to the traced process *pid* from the tracing process at location *data*. This parameter may not be available on all architectures. Implementations may choose to disallow some register modifications. The *addr* parameter is ignored.

#### PTRACE\_GETSIGINFO

This request writes information about the signal which caused the traced process *pid* to stop to the tracing process at location *data*, as a siginfo\_t. The *addr* parameter is ignored.

#### PTRACE\_SETSIGINFO

This request writes signal information to the traced process *pid* from a siginfo\_t structure pointed at by *data*, such that it will be used as the signal information by the traced process when it is resumed. The *addr* parameter is ignored.

### PTRACE\_GETEVENTMSG

This request stores information about the most recent ptrace event for the traced process *pid* in the unsigned long pointed at by *data*. For PTRACE\_EVENT\_EXIT, this is the exit status of the traced process. For PTRACE\_EVENT\_FORK, PTRACE\_EVENT\_VFORK, or PTRACE\_EVENT\_CLONE, this is the PID of the newly created process. The *addr* parameter is ignored.

#### PTRACE SYSCALL

This request performs the same function, in the same way, as PTRACE\_CONT, but with the additional step of causing the traced process to stop at the next entry to or exit from a system call. The usual events that would also cause the traced process to stop continue to do so.

#### PTRACE SINGLESTEP

This request performs the same function, in the same way, as PTRACE\_CONT, but with the additional step of causing the traced process to stop after execution of a single instruction. The usual events that would also cause the traced process to stop continue to do so.

#### PTRACE\_SYSEMU

This request performs the same function, in the same way, as PTRACE\_CONT, but with the additional step of causing the traced process to stop on entry to the next syscall, which will then not be executed.

#### PTRACE\_SYSEMU\_SINGLESTEP

This request performs the same function, in the same way, as PTRACE\_CONT, but with the additional step of causing the traced process to stop on entry to the next syscall, which will then not be executed. If the next instruction is not itself a syscall, the traced process will stop after a single instruction is executed.

#### PTRACE\_SETOPTIONS

This request sets ptrace() options for the traced process *pid* from the location pointed to by *data*. The *addr* is ignored. This location is interpreted as a bitmask of options, as defined by the following flags:

#### PTRACE\_O\_TRACESYSGOOD

This option, when set, causes syscall traps to set bit 7 in the signal number.

#### PTRACE\_O\_TRACEFORK

This option, when set, causes the traced process to stop when it calls fork(2). original traced process will stop with SIGTRAP PTRACE\_EVENT\_FORK << 8, and the new process will be stopped with SIGSTOP. The new process will also be traced by the tracing process, as if the tracing process had sent the PTRACE\_ATTACH request for that process. The PID of the new process may be retrieved with PTRACE\_GETEVENTMSG request.

#### PTRACE\_O\_TRACEVFORK

#### LSB Core - Generic 5.0

This option, when set, causes the traced process to stop when it calls vfork(2). The original traced process will stop with SIGTRAP  $\mid$  PTRACE\_EVENT\_VFORK << 8, and the new process will be stopped with SIGSTOP. The new process will also be traced by the tracing process, as if the tracing process had sent the PTRACE\_ATTACH request for that process. The PID of the new process may be retrieved with the PTRACE\_GETEVENTMSG request.

#### PTRACE\_O\_TRACECLONE

This option, when set, causes the traced process to stop when it calls clone(2). original traced process will stop with SIGTRAP PTRACE\_EVENT\_CLONE << 8, and the new process will be stopped with SIGSTOP. The new process will also be traced by the tracing process, as if the tracing process had sent the PTRACE\_ATTACH request for that process. The of new the process may be retrieved PTRACE\_GETEVENTMSG request. Under certain circumstances, clone(2) calls by the traced process will generate events and information consistent with the PTRACE\_O\_TRACEVFORK or PTRACE\_O\_TRACEFORK options above.

#### PTRACE\_O\_TRACEEXEC

This option, when set, causes the traced process to stop when it calls execve(2). The traced process will stop with SIGTRAP | PTRACE\_EVENT\_EXEC << 8.

#### PTRACE\_O\_TRACEVFORKDONE

This option, when set, causes the traced process to stop at the completion of its next vfork(2) call. The traced process will stop with SIGTRAP  $\mid$  PTRACE\_EVENT\_EXEC << 8.

#### PTRACE\_O\_TRACEEXIT

This option, when set, causes the traced process to stop upon exit. The traced process will stop with SIGTRAP | PTRACE\_EVENT\_EXIT << 8, and its exit status can be retrieved with the PTRACE\_GETEVENTMSG request. The stop is guaranteed to be early in the process exit process, meaning that information such as register status at exit is preserved. Upon continuing, the traced process will immediately exit.

### **Return Value**

On success, ptrace() shall return the requested data for PTRACE\_PEEK requests, or zero for all other requests. On error, all requests return -1, with errno set to an appropriate value. Note that -1 may be a valid return value for PTRACE\_PEEK requests; the application is responsible for distinguishing between an error condition and a valid return value in that case.

#### **Errors**

On error, ptrace() shall set errno to one of the regular error values below:

#### **EBUSY**

An error occurred while allocating or freeing a debug register.

#### EFAULT

The request attempted to read from or write to an invalid area in the memory space of the tracing or traced process.

#### EI0

The request was invalid, or it attempted to read from or write to an invalid area in the memory space of the tracing or traced process, or it violated a word-alignment boundary, or an invalid signal was given to continue the traced process.

#### FTNVAL

An attempt was made to set an invalid option.

#### **EPERM**

The request to trace a process was denied by the system.

#### **ESRCH**

The process requested does not exist, is not being traced by the current process, or is not stopped.

## putwc\_unlocked

## **Name**

putwc\_unlocked — non-thread-safe putwc

# **Description**

putwc\_unlocked() is the same as putwc(), except that it need not be thread-safe.
That is, it may only be invoked in the ways which are legal for getc\_unlocked().

## putwchar\_unlocked

## **Name**

putwchar\_unlocked — non-thread-safe putwchar

# **Description**

putwchar\_unlocked() is the same as putwchar(), except that it need not be threadsafe. That is, it may only be invoked in the ways which are legal for getc\_unlocked().

## pwrite64

#### **Name**

pwrite64 — write on a file (Large File Support)

# **Synopsis**

```
#include <unistd.h>
ssize_t pwrite64(int fd, const void * buf, size_t count, off64_t
offset);
```

# **Description**

pwrite64() shall write *count* bytes from *buf* to the file associated with the open file descriptor *fd*, at the position specified by *offset*, without changing the file position.

pwrite64() is a large-file version of the pwrite() function as defined in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009). It differs from pwrite() in that the *offset* parameter is an off64\_t instead of an off\_t

## **Return Value**

On success, pwrite64() shall return the number of bytes actually written. Otherwise pwrite() shall return -1 and set errno to indicate the error.

## **Errors**

See pwrite() for possible error values.

## random\_r

#### **Name**

random\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int random_r(struct random_data * buffer, int32_t * result);
```

# **Description**

The interface random\_r() shall function in the same way as the interface random(), except that random\_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48\_r(), seed48\_r(), or srand48\_r(), or by filling it with zeroes.

## readdir64\_r

#### **Name**

readdir64\_r — read a directory (Large File Support)

# **Synopsis**

```
#include <dirent.h>
int readdir64_r(DIR * dirp, struct dirent64 * entry, struct dirent64
* * result);
```

## **Description**

The readdir64\_r() function is a large file version of readdir\_r(). It shall behave as readdir\_r() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009</u>), except that the *entry* and *result* arguments are dirent64 structures rather than dirent.

## **Return Value**

See readdir\_r().

#### **Errors**

See readdir\_r().

## regexec

#### **Name**

regexec — regular expression matching

# **Description**

The regexec() function shall behave as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except with differences as listed below.

#### **Differences**

Certain aspects of regular expression matching are optional; see Regular Expressions.

#### scandir64

#### **Name**

scandir64 — scan a directory (Large File Support)

# **Synopsis**

```
#include <dirent.h>
int scandir64(const char * dir, const struct dirent64 ** namelist,
int (*sel) (const struct dirent64 *), int (*compar) (const struct
dirent64 **, const struct dirent64 **));
```

# **Description**

scandir64() is a large-file version of the scandir() function as defined in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. If differs only in that the *namelist* and the paramters to the selection function *sel* and comparison function *compar* are of type dirent64 instead of type dirent.

### scanf

### Name

scanf — convert formatted input

# **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

## **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

# sched\_getaffinity

#### Name

sched\_getaffinity — retrieve the affinity mask of a process

# **Synopsis**

#include <sched.h>
int sched\_getaffinity(pid\_t pid, unsigned int cpusetsize, cpu\_set\_t \*
mask);

## **Description**

sched\_getaffinity() shall retrieve the affinity mask of a process.

The parameter *pid* specifies the ID for the process. If *pid* is 0, then the calling process is specified instead.

The parameter *cpusetsize* specifies the length of the data pointed to by *mask*, in bytes. Normally, this parameter is specified as sizeof(cpu\_set\_t).

## **Return Value**

On success, sched\_getaffinity() shall return 0, and the structure pointed to by *mask* shall contain the affinity mask of the specified process.

On failure, sched\_getaffinity() shall return -1 and set errno as follows.

## **Errors**

#### **EFAULT**

Bad address.

#### **EINVAL**

*mask* does not specify any processors that exist in the system, or *cpusetsize* is smaller than the kernel's affinity mask.

#### **ESRCH**

The specified process could not be found.

### See Also

sched\_setscheduler(), sched\_setaffinity().

## sched\_setaffinity

#### **Name**

sched\_setaffinity — set the CPU affinity mask for a process

# **Synopsis**

#include <sched.h>
int sched\_setaffinity(pid\_t pid, unsigned int cpusetsize, cpu\_set\_t \*
mask);

## **Description**

sched\_setaffinity() shall set the CPU affinity mask for a process.

The parameter *pid* specifies the ID for the process. If *pid* is 0, then the calling process is specified instead.

The parameter *cpusetsize* specifies the length of the data pointed to by *mask*, in bytes. Normally, this parameter is specified as sizeof(cpu\_set\_t).

The parameter *mask* specifies the new value for the CPU affinity mask. The structure pointed to by *mask* represents the set of CPUs on which the process may run. If *mask* does not specify one of the CPUs on which the specified process is currently running, then sched\_setaffinity() shall migrate the process to one of those CPUs.

Setting the mask on a multiprocessor system can improve performance. For example, setting the mask for one process to specify a particular CPU, and then setting the mask of all other processes to exclude the CPU, dedicates the CPU to the process so that the process runs as fast as possible. This technique also prevents loss of performance in case the process terminates on one CPU and starts again on another, invalidating cache.

#### Return Value

On success, sched\_setaffinity() shall return 0.

On failure, sched\_setaffinity() shall return -1 and set errno as follows.

## **Errors**

#### **EFAULT**

Bad address.

#### **EINVAL**

*mask* does not specify any processors that exist in the system, or *cpusetsize* is smaller than the kernel's affinity mask.

#### **EPERM**

Insufficient privileges. The effective user ID of the process calling sched\_setaffinity() is not equal to the user ID or effective user ID of the specified process, and the calling process does not have appropriate privileges.

#### **ESRCH**

The specified process could not be found.

## See Also

sched\_setscheduler(), sched\_getaffinity().

## sched\_setscheduler

### **Name**

sched\_setscheduler — set scheduling policy and parameters

# **Synopsis**

```
#include <sched.h>
int sched_setscheduler(pid_t pid, int policy, const struct
sched_param * param);
```

## **Description**

The sched\_setscheduler() shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

## **Return Value**

On success, 0 is returned instead of the former scheduling policy.

### seed48\_r

### Name

seed48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int seed48_r(unsigned short[3] seed16v, struct drand48_data *
buffer);
```

# **Description**

The interface seed48\_r() shall function in the same way as the interface seed48(), except that seed48\_r() shall use the data in *buffer* instead of the global random number generator state.

#### sendfile

#### **Name**

sendfile — transfer data between two file descriptors

# **Synopsis**

```
#include <sys/sendfile.h>
ssize_t sendfile(int out_fd, int in_fd, off_t * offset, size_t
count);
```

# **Description**

The sendfile() function shall copy data between the file descriptor  $in_fd$ , which must not be a socket, and the file descriptor  $out_fd$ , which must be a socket.  $in_fd$  should be opened for reading, and  $out_fd$  should be opened for writing.

The *offset* parameter points to a variable set to the file offset at which sendfile() shall start reading from  $in\_fd$ , unless it is NULL. On exit, this variable shall contain the offset of the byte immediately after the last byte read. sendfile() shall not change the current file offset of  $in\_fd$ , unless it is NULL. In that case, sendfile() shall adjust the current file offset to show how many bytes were read.

The *count* parameter specifies how many bytes to copy.

#### **Return Value**

On success, sendfile() shall return the number of bytes written to  $out_fd$ .

On failure, sendfile() shall return -1 and set errno appropriately, as follows.

#### **Errors**

**EAGAIN** 

Non-blocking I/O with O\_NONBLOCK has been chosen, but the write would block.

**EBADF** 

The input file is not open for reading, or the output file is not open for writing.

**EFAULT** 

Bad address.

**EINVAL** 

An mmap()-like operation is unavailable for  $in_fd$ , or file descriptor is locked or invalid.

EIO

There was an unspecified error while reading.

**ENOMEM** 

There is not enough memory to read from *in\_fd*.

### **Notes**

sendfile() is usually faster than combining read() and write() calls, because it is part of the kernel. However, if it fails with EINVAL, falling back to read() and write() may be advisable.

It is advisable for performance reasons to use the TCP\_CORK option of the tcp() function when sending header data with file contents to a TCP socket. This minimizes the number of packets.

### See Also

```
mmap(), open(), socket(), splice().
```

#### sendfile64

#### **Name**

sendfile64 — transfer data between two file descriptors (Large File Support)

# **Synopsis**

```
#include <sys/sendfile.h>
ssize_t sendfile64(int out_fd, int in_fd, off64_t * offset, size_t
count);
```

# **Description**

The sendfile64() function is a large-file version of the sendfile() function.

#### setbuffer

### **Name**

setbuffer — stream buffering operation

# **Synopsis**

```
#include <stdio.h>
void setbuffer(FILE * stream, char * buf, Size_t size);
```

# **Description**

setbuffer() is an alias for the call to setvbuf(). It works the same, except that the size of the buffer in setbuffer() is up to the caller, rather than being determined by the default *BUFSIZ*.

## setgroups

### Name

setgroups — set list of supplementary group IDs

# **Synopsis**

```
#include <grp.h>
int setgroups(Size_t size, const gid_t * list);
```

# **Description**

If the process has appropriate privilege, the setgroups() function shall set the supplementary group IDs for the current process. <code>list</code> shall reference an array of <code>size</code> group IDs. A process may have at most NGROUPS\_MAX supplementary group IDs.

#### **Return Value**

On successful completion, 0 is returned. On error, -1 is returned and the errno is set to indicate the error.

## **Errors**

**EFAULT** 

list has an invalid address.

**EPERM** 

The process does not have appropriate privileges.

**EINVAL** 

size is greater than NGROUPS\_MAX.

### sethostname

#### **Name**

sethostname — set host name

# **Synopsis**

```
#include <unistd.h>
#include <sys/param.h.h>
```

```
#include <sys/utsname.h>
int sethostname(const char * name, size_t len);
```

# **Description**

If the process has appropriate privileges, the sethostname() function shall change the host name for the current machine. The *name* shall point to a null-terminated string of at most *len* bytes that holds the new hostname.

If the symbol HOST\_NAME\_MAX is defined, or if <code>sysconf(\_SC\_HOST\_NAME\_MAX)()</code> returns a value greater than 0, this value shall represent the maximum length of the new hostname. Otherwise, if the symbol MAXHOSTLEN is defined, this value shall represent the maximum length for the new hostname. If none of these values are defined, the maximum length shall be the size of the *nodename* field of the utsname structure.

### **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

#### **Errors**

**EINVAL** 

*1en* is negative or larger than the maximum allowed size.

**EPERM** 

the process did not have appropriate privilege.

**EFAULT** 

name is an invalid address.

## Rationale

POSIX 1003.1-2008 (ISO/IEC 9945-2009) guarantees that:

Maximum length of a host name (not including the terminating null) as returned from the gethostname() function shall be at least 255 bytes.

The glibc C library does not currently define HOST\_NAME\_MAX, and although it provides the name \_SC\_HOST\_NAME\_MAX a call to sysconf() returns -1 and does not alter errno in this case (indicating that there is no restriction on the hostname length). However, the glibc manual idicates that some implementations may have MAXHOSTNAMELEN as a means of detecting the maximum length, while the Linux kernel at release 2.4 and 2.6 stores this hostname in the utsname structure. While the glibc manual suggests simply shortening the name until sethostname() succeeds, the LSB requires that one of the first four mechanisms works. Future versions of glibc may provide a more reasonable result from sysconf(\_SC\_HOST\_NAME\_MAX).

## setsockopt

#### Name

setsockopt — set socket options

# **Synopsis**

#include <sys/socket.h>

#### LSB Core - Generic 5.0

#include <netinet/ip.h>
int setsockopt(int socket, int level, int option\_name, const void \*
option\_value, socklen\_t option\_len);

## **Description**

The setsockopt() function shall behave as specified in <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), with the following extensions.

#### **IP Protocol Level Options**

If the *level* parameter is IPPROTO\_IP, the following values shall be supported for *option\_name* (see <u>RFC 791:Internet Protocol</u> for further details):

#### IP OPTIONS

Set the Internet Protocol options sent with every packet from this socket. The *option\_value* shall point to a memory buffer containing the options and *option\_len* shall contain the size in bytes of that buffer. For IPv4, the maximum length of options is 40 bytes.

#### IP\_TOS

Set the Type of Service flags to use when sending packets with this socket. The *option\_value* shall point to a value containing the type of service value. The least significant two bits of the value shall contain the new Type of Service indicator. Use of other bits in the value is unspecified. The *option\_len* parameter shall hold the size, in bytes, of the buffer referred to by *option\_value*.

#### IP TTL

Set the current unicast Internet Protocol Time To Live value used when sending packets with this socket. The *option\_value* shall point to a value containing the time to live value, which shall be between 1 and 255. The *option\_len* parameter shall hold the size, in bytes, of the buffer referred to by *option\_value*.

### IP\_MULTICAST\_TTL

Sets the Time To Live value of outgoing multicast packets for this socket. *optval* shall point to an integer which contains the new TTL value. If the new TTL value is -1, the implementation should use an unspecified default TTL value. If the new TTL value is out of the range of acceptable values (0-255), setsockopt() shall return -1 and set errno to indicate the error.

#### IP\_MULTICAST\_LOOP

Sets a boolean flag indicating whether multicast packets originating locally should be looped back to the local sockets. *optval* shall point to an integer which contains the new flag value.

#### IP\_ADD\_MEMBERSHIP

Join a multicast group. *optval* shall point to a ip\_mreq structure. Before calling, the caller should fill in the *imr\_multiaddr* field with the multicast group address and the *imr\_address* field with the address of the local interface. If *imr\_address* is set to INADDR\_ANY, then an appropriate interface is chosen by the system.

#### IP\_DROP\_MEMBERSHIP

Leave a multicast group. *optval* shall point to a ip\_mreq structure containing the same values as were used with IP\_ADD\_MEMBERSHIP.

#### IP\_MULTICAST\_IF

Set the local device for a multicast socket. *optval* shall point to either an ip\_mreqn structure or an in\_addr structure. If using the ip\_mreqn structure, the *imr\_multiaddr* field should be set to multicast group address, the *imr\_address* field to the address of the local interface, and the *imr\_index* field to the interface index. If using the in\_addr structure, the address of the local interface shall be specified. If *in\_addr* or *imr\_address* is set to INADDR\_ANY, then an appropriate interface is chosen by the system. If *imr\_index* is zero, then an appropriate interface index is chosen by the implementation.

The ip\_mreq structure contains two struct in\_addr fields: imr\_multiaddr and imr\_address.

#### **Return Value**

On success, 0 is returned. On error, -1 is returned and the global variable errno is set appropriately.

## **Errors**

As defined in POSIX 1003.1-2001 (ISO/IEC 9945-2003).

#### setstate\_r

### Name

 $\verb|setstate_r| - \verb|reentrantly| change the state array used by random number generator functions$ 

# **Synopsis**

```
#include <stdlib.h>
int setstate_r(char * statebuf, struct random_data * buf);
```

# **Description**

The interface setstate\_r() shall function in the same way as the interface set-state(), except that setstate\_r() shall use the data in *statebuf* instead of the global random number generator state.

#### setutent

#### Name

setutent — access user accounting database entries

# **Synopsis**

```
#include <utmp.h>
void setutent(void);
```

# **Description**

The setutent() function shall reset the user accounting database such that the next call to getutent() shall return the first record in the database. It is recommended to call it before any of the other functions that operate on the user accounting databases (e.g. getutent())

## **Return Value**

None.

## sigandset

#### **Name**

sigandset — build a new signal set by combining the two input sets using logical AND

# **Synopsis**

```
#include <signal.h>
int sigandset(sigset_t * set, const sigset_t * left, const sigset_t
* right);
```

# **Description**

The sigandset() function shall combine the two signal sets referenced by *left* and *right*, using a logical AND operation, and shall place the result in the location referenced by *set*, The resulting signal set shall contain only signals that are in both the set referenced by *left* and the set referenced by *right*.

Applications shall call sigemptyset() or sigfillset() at least once for each object of type sigset\_t to initialize it. If an uninitialized or NULL object is passed to sigand-set(), the results are undefined.

## **Return Value**

sigandset() returns 0. There are no defined error returns.

## See Also

sigorset()

# sigisemptyset

#### **Name**

sigisemptyset — check for empty signal set

# **Synopsis**

```
#include <signal.h>
int sigisemptyset(const sigset_t * set);
```

# **Description**

The sigisemptyset() function shall check for empty signal set referenced by set.

Applications shall call sigemptyset() or sigfillset() at least once for each object of type sigset\_t to initialize it. If an uninitialized or NULL object is passed to sigisemptyset(), the results are undefined.

#### Return Value

The sigisemptyset() function shall return a positive non-zero value if the signal set referenced by *set* is empty, or zero if this set is empty. There are no defined error returns.

## sigorset

#### **Name**

sigorset — build a new signal set by combining the two input sets using logical OR

# **Synopsis**

```
#include <signal.h>
int sigorset(sigset_t * set, const sigset_t * left, const sigset_t *
right);
```

# **Description**

The sigorset() function shall combine the two signal sets referenced by *left* and *right*, using a logical OR operation, and shall place the result in the location referenced by *set*, The resulting signal set shall contain only signals that are in either the set referenced by *left* or the set referenced by *right*.

Applications shall call sigemptyset() or sigfillset() at least once for each object of type sigset\_t to initialize it. If an uninitialized or NULL object is passed to sigorset(), the results are undefined.

## **Return Value**

sigorset() returns 0. There are no defined error returns.

## See Also

sigandset()

# sigpause

#### Name

signause — remove a signal from the signal mask and suspend the thread (deprecated)

# **Synopsis**

```
#include <signal.h>
int sigpause(int sig);
```

# **Description**

The sigpause() function is deprecated from the LSB and is expected to disappear from a future version of the LSB. Conforming applications should use sigsuspend() instead.

In the source standard, sigpause() is implemented as a macro causing it to behave as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, and is equivalent to the function <u>\_xpg\_sigpause()</u>. If the macro is undefined, sigpause() from the binary standard is used, with differences as described here:

The sigpause() function shall block those signals indicated by sig and suspend execution of the thread until a signal is delivered. When a signal is delivered, the original signal mask shall be restored.

#### See Also

```
__xpg_sigpause()
```

# sigreturn

#### **Name**

sigreturn — return from signal handler and cleanup stack frame

# **Synopsis**

```
int sigreturn(struct sigcontext * scp);
```

# **Description**

The sigreturn() function is used by the system to cleanup after a signal handler has returned. This function is not in the source standard; it is only in the binary standard.

## **Return Value**

sigreturn() never returns.

## srand48\_r

#### **Name**

srand48\_r — reentrantly generate pseudorandom numbers in a uniform distribution

# **Synopsis**

```
#include <stdlib.h>
int srand48_r(long int seedval, struct drand48_data * buffer);
```

# **Description**

The interface srand48\_r() shall function in the same way as the interface srand48(), except that srand48\_r() shall use the data in *buffer* instead of the global random number generator state.

### srandom\_r

## Name

srandom\_r — reentrantly set the seed for a new sequence of pseudorandom numbers

# **Synopsis**

```
#include <stdlib.h>
int srandom_r(unsigned int seed, struct random_data * buffer);
```

# **Description**

The interface srandom\_r() shall function in the same way as the interface srandom(), except that srandom\_r() shall use the data in *buffer* instead of the global random number generator state.

### sscanf

### **Name**

sscanf — convert formatted input

# **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

## **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

#### statfs

#### Name

statfs — (deprecated)

# **Synopsis**

```
#include <sys/statfs.h>
int statfs(const char *path, struct statfs *buf);
```

# **Description**

The statfs() function returns information about a mounted file system. The file system is identified by *path*, a path name of a file within the mounted filesystem. The results are placed in the structure pointed to by

Fields that are undefined for a particular file system shall be set to 0.

**Note:** Application developers should use the statvfs() function to obtain general file system information. Applications should only use the statfs() function if they must determine the file system type, which need not be provided by statvfs().

## **Return Value**

On success, the statfs() function shall return 0 and set the fields of the structure idenfitied by *buf* accordingly. On error, the statfs() function shall return -1 and set erron accordingly.

## **Errors**

#### **ENOTDIR**

A component of the path prefix of path is not a directory.

#### **ENAMETOOLONG**

path is too long.

#### **ENOENT**

The file referred to by path does not exist.

#### **EACCES**

Search permission is denied for a component of the path prefix of *path*.

#### **ELOOP**

Too many symbolic links were encountered in translating *path*.

#### **EFAULT**

buf or path points to an invalid address.

#### **EIO**

An I/O error occurred while reading from or writing to the file system.

#### **ENOMEM**

Insufficient kernel memory was available.

#### **ENOSYS**

The filesystem path is on does not support statfs().

#### statfs64

### **Name**

statfs64 — (deprecated)

# **Synopsis**

```
#include <sys/statfs.h>
int statfs64(const char * path, struct statfs64 *buf);
```

# **Description**

The statfs64() function returns information about a mounted file system. The file system is identified by *path*, a path name of a file within the mounted filesystem. The results are placed in the structure pointed to by *buf*.

statfs64() is a large-file version of the statfs() function.

Fields that are undefined for a particular file system shall be set to 0.

**Note:** Application developers should use the statvfs64() function to obtain general file system information. Applications should only use the statfs64() function if they must determine the file system type, which need not be provided by statvfs64().

### **Return Value**

On success, the statfs64() function shall return 0 and set the fields of the structure idenfitied by *buf* accordingly. On error, the statfs64() function shall return -1 and set errno accordingly.

### **Errors**

See fstatfs().

### stime

#### **Name**

stime — set time

# **Synopsis**

#define \_SVID\_SOURCE

```
#include <time.h>
int stime(const time_t * t);
```

# **Description**

If the process has appropriate privilege, the stime() function shall set the system's idea of the time and date. Time, referenced by t, is measured in seconds from the epoch (defined in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> as 00:00:00 UTC January 1, 1970).

## **Return Value**

On success, stime() shall return 0. Otherwise, stime() shall return -1 and errno shall be set to indicate the error.

## **Errors**

**EPERM** 

The process does not have appropriate privilege.

EINVAL

t is a null pointer.

#### strcasestr

### **Name**

strcasestr — locate a substring ignoring case

# **Synopsis**

```
#include <string.h>
char * strcasestr(const char * s1, const char * s2);
```

# **Description**

The strcasestr() shall behave as strstr(), except that it shall ignore the case of both strings. The strcasestr() function shall be locale aware; that is strcasestr() shall behave as if both strings had been converted to lower case in the current locale before the comparison is performed.

## **Return Value**

Upon successful completion, strcasestr() shall return a pointer to the located string or a null pointer if the string is not found. If s2 points to a string with zero length, the function shall return s1.

## strerror\_r

### **Name**

strerror\_r — return string describing error number

# **Synopsis**

```
#include <string.h>
char * strerror_r(int errnum, char * buf, size_t buflen);
```

# **Description**

In the source standard, strerror\_r() is implemented as a macro causing it to behave as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, and is equivalent to the function \_\_xpg\_strerror\_r(). If the macro is undefined, strerror\_r() from the binary standard is used, with differences as described here.

The strerror\_r() function shall return a pointer to the string corresponding to the error number *errnum*. The returned pointer may point within the buffer *buf* (at most *buflen* bytes).

## **Return Value**

On success, strerror\_r() shall return a pointer to the generated message string (determined by the setting of the LC\_MESSAGES category in the current locale). Otherwise, strerror\_r() shall return the string corresponding to "Unknown error".

## See Also

```
__xpg_strerror_r()
```

### strptime

### **Name**

strptime — parse a time string

## **Description**

The strptime() shall behave as specified in the <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> with differences as listed below.

### Number of leading zeroes may be limited

The *POSIX 1003.1-2008 (ISO/IEC 9945-2009)* specifies fields for which "leading zeros are permitted but not required"; however, applications shall not expect to be able to supply more leading zeroes for these fields than would be implied by the range of the field. Implementations may choose to either match an input with excess leading zeroes, or treat this as a non-matching input. For example, %j has a range of 001 to 366, so 0, 00, 000, 001, and 045 are acceptable inputs, but inputs such as 0000, 0366 and the like are not.

### **Rationale**

glibc developers consider it appropriate behavior to forbid excess leading zeroes. When trying to parse a given input against several format strings, forbidding excess leading zeroes could be helpful. For example, if one matches 0011-12-26 against %m-%d-%Y and then against %Y-%m-%d, it seems useful for the first match to fail, as it would be perverse to parse that date as November 12, year 26. The second pattern parses it as December 26, year 11.

The <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> is not explicit that an unlimited number of leading zeroes are required, although it may imply this. The LSB explicitly allows implementations to have either behavior. Future versions of this standard may require implementations to forbid excess leading zeroes.

An Interpretation Request is currently pending against <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> for this matter.

### strsep

### **Name**

strsep — extract token from string

## **Synopsis**

```
#include <string.h>
char * strsep(char * * stringp, const char * delim);
```

## **Description**

The strsep() function shall find the first token in the string referenced by the pointer *stringp*, using the characters in *delim* as delimiters.

If stringp is NULL, strsep() shall return NULL and do nothing else.

If *stringp* is non-NULL, strsep() shall find the first token in the string referenced by *stringp*, where tokens are delimited by characters in the string *delim*. This token shall be terminated with a \0 character by overwriting the delimiter, and *stringp* shall be updated to point past the token. In case no delimiter was found, the token is taken to be the entire string referenced by *stringp*, and the location referenced by *stringp* is made NULL.

### **Return Value**

strsep() shall return a pointer to the beginning of the token.

### **Notes**

The strsep() function was introduced as a replacement for strtok(), since the latter cannot handle empty fields. However, strtok() conforms to <u>ISO C (1999)</u> and to <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> and hence is more portable.

### See Also

```
strtok(), strtok_r().
```

### strtoq

#### **Name**

strtoq — convert string value to a long or quad\_t integer

# **Synopsis**

```
#include <sys/types.h>
#include <stdlib.h>
```

#### LSB Core - Generic 5.0

```
#include <limits.h>
long long strtoq(const char * nptr, char * * endptr, int base);
```

## **Description**

strtoq() converts the string nptr to a quadt value. The conversion is done according to the given base, which shall be between 2 and 36 inclusive, or be the special value 0.

nptr may begin with an arbitrary amount of white space (as determined by isspace()), followed by a single optional + or - sign character. If base is 0 or 16, the string may then include a 0x prefix, and the number will be read in base 16; otherwise, a 0 base is taken as 10 (decimal), unless the next character is 0, in which case it is taken as 8 (octal).

The remainder of the string is converted to a long value in the obvious manner, stopping at the first character which is not a valid digit in the given base. (In bases above 10, the letter A in either upper or lower case represents 10, B represents 11, and so forth, with Z representing 35.)

### **Return Value**

strtoq() returns the result of the conversion, unless the value would underflow or overflow. If an underflow occurs, strtoq() returns QUAD\_MIN. If an overflow occurs, strtoq() returns QUAD\_MAX. In both cases, the global variable errno is set to ERANGE.

### **Errors**

**ERANGE** 

The given string was out of range; the value converted has been clamped.

### strtouq

#### **Name**

strtouq — convert a string to an unsigned long long

## **Synopsis**

#include <sys/types.h>
#include <stdlib.h>

```
#include <limits.h>
unsigned long long strtouq(const char * nptr, char * * endptr, int
base);
```

## **Description**

strtouq() converts the string *nptr* to an unsigned long long value. The conversion is done according to the given base, which shall be between 2 and 36 inclusive, or be the special value 0.

nptr may begin with an arbitrary amount of white space (as determined by isspace()), followed by a single optional + or - sign character. If base is 0 or 16, the string may then include a 0x prefix, and the number will be read in base 16; otherwise, a 0 base is taken as 10 (decimal), unless the next character is 0, in which case it is taken as 8 (octal).

The remainder of the string is converted to an unsigned long value in the obvious manner, stopping at the end of the string or at the first character that does not produce a valid digit in the given base. (In bases above 10, the letter A in either upper or lower case represents 10, B represents 11, and so forth, with Z representing 35.)

### **Return Value**

On success, strtouq() returns either the result of the conversion or, if there was a leading minus sign, the negation of the result of the conversion, unless the original (nonnegated) value would overflow. In the case of an overflow the function returns UQUAD\_MAX and the global variable errno is set to ERANGE.

### **Errors**

**ERANGE** 

The given string was out of range; the value converted has been clamped.

## svc\_register

#### Name

svc\_register — register Remote Procedure Call interface

# **Synopsis**

```
#include <rpc/rpc.h>
bool_t svc_register(SVCXPRT * xprt, rpcprog_t prognum, rpcvers_t
versnum, __dispatch_fn_t dispatch, rpcprot_t protocol);
```

# **Description**

The svc\_register() function shall associate the program identified by *prognum* at version *versnum* with the service dispatch procedure, *dispatch*. If *protocol* is zero, the service is not registered with the portmap service. If *protocol* is non-zero, then a mapping of the triple [*prognum*, *versnum*, *protocol*] to xprt->xp\_port is established with the local portmap service. The procedure *dispatch* has the following form:

```
int dispatch(struct svc_req * request, SVCXPRT * xprt);
```

### **Return Value**

svc\_register() returns 1 if it succeeds, and zero otherwise.

364

### svc\_run

### Name

svc\_run — waits for RPC requests to arrive and calls service procedure

## **Synopsis**

#include <rpc/svc.h>
void svc\_run(void);

## **Description**

The svc\_run() function shall wait for RPC requests to arrive, read and unpack each request, and dispatch it to the appropriate registered handler. Under normal conditions, svc\_run() shall not return; it shall only return if serious errors occur that prevent further processing.

## svc\_sendreply

### Name

svc\_sendreply — called by RPC service's dispatch routine

## **Synopsis**

bool\_t svc\_sendreply(SVCXPRT \*xprt, xdrproc\_t outproc, caddr\_t out);

## **Description**

Called by an RPC service's dispatch routine to send the results of a remote procedure call. The parameter *xprt* is the request's associated transport handle; *outproc* is the XDR routine which is used to encode the results; and *out* is the address of the results. This routine returns one if it succeeds, zero otherwise.

### svctcp\_create

### **Name**

svctcp\_create — create a TCP/IP-based RPC service transport

## **Synopsis**

```
#include <rpc/rpc.h>
SVCXPRT * svctcp_create(int sock, u_int send_buf_size, u_int
recv_buf_size);
```

## **Description**

svctcp\_create() creates a TCP/IP-based RPC service transport, to which it returns a pointer. The transport is associated with the socket *sock*, which may be RPC\_ANYSOCK, in which case a new socket is created. If the socket is not bound to a local TCP port, then this routine binds it to an arbitrary port. Upon completion, xprt->xp\_sock is the transport's socket descriptor, and xprt->xp\_port is the transport's port number. Since TCP-based RPC uses buffered I/O, users may specify the size of buffers; values of zero choose suitable defaults.

### **Return Value**

svctcp\_create() returns NULL if it fails, or a pointer to the RPC service transport otherwise.

### svcudp\_create

### Name

svcudp\_create — create a UDP-based RPC service transport

# **Synopsis**

```
SVCXPRT *
svcudp_create(int sock);
```

# **Description**

The svcudp\_create() function shall create a UDP/IP-based RPC service transport, and return a pointer to its descriptor. The transport is associated with the socket sock, which may be RPC\_ANYSOCK, in which case a new socket shall be created. If the socket is not bound to a local UDP port, then svcudp\_create() shall bind it to an arbitrary port.

If  $svcudp\_create()$  returns successfully, then the  $xp\_sock$  field in the result shall be the transport's socket descriptor, and the  $xp\_port$  field shall be the transport's port number.

### **Return Value**

Upon successful completion, svcudp\_create() shall return a pointer to a RPC service transport; otherwise, a null pointer shall be returned.

### swscanf

### Name

swscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

### sysconf

### **Name**

sysconf — Get configuration information at runtime

## **Synopsis**

```
#include <unistd.h>
long sysconf(int name);
```

### **DESCRIPTION**

sysconf() is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Extra Variables**

These additional values extend the list in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

- \_SC\_PHYS\_PAGES

The number of pages of physical memory.

- \_SC\_AVPHYS\_PAGES

The number of currently available pages of physical memory.

- \_SC\_NPROCESSORS\_CONF

The number of processors configured.

- \_SC\_NPROCESSORS\_ONLN

The number of processors currently online (available).

### **Extra Versions**

While this specification only requires conformance with <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, implementations are not constrained from moving on and claiming conformance with a subsequent edition, <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. Thus for run-time checks using sysconf(), the wording is amended to allow return values of 0, -1, 200112L or 200809L where formerly 200809L was not listed as allowed.

368

## sysinfo

### Name

sysinfo — return system information

## **Synopsis**

#include <sys/sysinfo.h>
int sysinfo(struct sysinfo \*info);

## **Description**

sysinfo() provides a way to obtain certain system statistics. Statistics are written into a sysinfo structure pointed to by *info*. Elements which take a size are sized in units indicated by the value of the *mem\_unit* member of *info*. The other members have traditional meanings as indicated in Data Definitions, but are not formally part of this specification.

### **Return Value**

Returns zero on success. On error, -1 is returned and errno is set to indicate the error.

### **Errors**

**EFAULT** 

The *info* parameter does not point to a valid sysinfo structure.

### system

### **Name**

system — execute a shell command

## **Synopsis**

```
#include <stdlib.h>
int system(const char * string);
```

## **Description**

The system() function shall behave as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

### **Notes**

The fact that <code>system()</code> ignores interrupts is often not what a program wants. <a href="POSIX">POSIX</a> 1003.1-2008 (ISO/IEC 9945-2009) describes some of the consequences; an additional consequence is that a program calling <code>system()</code> from a loop cannot be reliably interrupted. Many programs will want to use the <code>exec()</code> family of functions instead.

Do not use system() from a program with suid or sgid privileges, because unexpected values for some environment variables might be used to subvert system integrity. Use the exec() family of functions instead, but not execlp() or execvp(). system() will not, in fact, work properly from programs with suid or sgid privileges on systems on which /bin/sh is bash version 2, since bash 2 drops privileges on startup. (Debian uses a modified bash which does not do this when invoked as sh.)

The check for the availability of /bin/sh is not actually performed; it is always assumed to be available. <u>ISO C (1999)</u> specifies the check, but <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>) specifies that the return shall always be nonzero, since a system without the shell is not conforming, and it is this that is implemented.

It is possible for the shell command to return 127, so that code is not a sure indication that the execve() call failed; check the global variable errno to make sure.

### textdomain

### **Name**

textdomain — set the current default message domain

## **Synopsis**

```
#include <libintl.h>
char * textdomain(const char * domainname);
```

## **Description**

The textdomain() function shall set the current default message domain to *domain-name*. Subsequent calls to gettext() and ngettext() use the default message domain.

If domainname is NULL, the default message domain shall not be altered.

If domainname is "", textdomain() shall reset the default domain to the system default of "messages".

#### Return

On success, textdomain() shall return the currently selected domain. Otherwise, a null pointer shall be returned, and errno is set to indicate the error.

### **Errors**

**ENOMEM** 

Insufficent memory available.

### unlink

### **Name**

unlink — remove a directory entry

# **Synopsis**

```
int unlink(const char * path);
```

# **Description**

unlink() is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

See also Section 18.1, Additional behaviors: unlink/link on directory.

### May return EISDIR on directories

If *path* specifies a directory, the implementation may return EISDIR instead of EPERM as specified by <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

**Rationale:** The Linux kernel has deliberately chosen EISDIR for this case and does not expect to change.

### utmpname

### **Name**

utmpname — set user accounting database

## **Synopsis**

```
#include <utmp.h>
int utmpname(const char * dbname);
```

## **Description**

The utmpname() function shall cause the user accounting database used by the getutent(), getutent\_r(), getutxent(), getutxid(), getutxline(), and pututxline() functions to be that named by *dbname*, instead of the system default database. See <u>Section 18.3</u> for further information.

**Note:** The LSB does not specify the format of the user accounting database, nor the names of the file or files that may contain it.

### **Return Value**

None.

### **Errors**

None defined.

## vasprintf

### **Name**

vasprintf — write formatted output to a dynamically allocated string

# **Synopsis**

```
#include <stdarg.h>
#include <stdio.h>
int vasprintf(char * * restrict ptr, const char * restrict format,
va_list arg);
```

# **Description**

The vasprintf() function shall write formatted output to a dynamically allocated string, and store the address of that string in the location referenced by *ptr*. It shall behave as asprintf(), except that instead of being called with a variable number of arguments, it is called with an argument list as defined by <stdarg.h>.

### **Return Value**

Refer to fprintf().

### **Errors**

Refer to fprintf().

#### verrx

### **Name**

verrx — display formatted error message and exit

## **Synopsis**

```
#include <stdarg.h>
#include <err.h>
void verrx (int eval , const char * fmt , va_list args );
```

## **Description**

The verrx() shall behave as errx() except that instead of being called with a variable number of arguments, it is called with an argument list as defined by <stdarg.h>.

verrx() does not return, but exits with the value of eval.

### **Return Value**

None.

### **Errors**

None.

### vfscanf

### **Name**

vfscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

#### Differences

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

### vfwscanf

### Name

vfwscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

#### vscanf

### **Name**

vscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

### vsscanf

### **Name**

vsscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

#### vswscanf

### **Name**

vswscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

## vsyslog

### **Name**

vsyslog — log to system log

# **Synopsis**

#include <stdarg.h>

```
#include <syslog.h>
void vsyslog(int priority, char * message, va_list arglist);
```

## **Description**

The vsyslog() function is identical to syslog() as specified in <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), except that *arglist* (as defined by stdarg.h) replaces the variable number of arguments.

### vwscanf

### **Name**

vwscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

### wait4

### Name

wait4 — wait for process termination, BSD style

# **Synopsis**

#include <sys/types.h>
#include <sys/resource.h>

```
#include <sys/wait.h>
pid_t wait4(pid_t pid, int * status, int options, struct rusage *
rusage);
```

## **Description**

wait4() suspends execution of the current process until a child (as specified by *pid*) has exited, or until a signal is delivered whose action is to terminate the current process or to call a signal handling function. If a child (as requested by *pid*) has already exited by the time of the call (a so-called "zombie" process), the function returns immediately. Any system resources used by the child are freed.

The value of *pid* can be one of:

< -1

wait for any child process whose process group ID is equal to the absolute value of pid.

-1

wait for any child process; this is equivalent to calling wait3().

0

wait for any child process whose process group ID is equal to that of the calling process.

>0

wait for the child whose process ID is equal to the value of pid.

The value of options is a bitwise or of zero or more of the following constants:

#### WNOHANG

return immediately if no child is there to be waited for.

#### WUNTRACED

return for children that are stopped, and whose status has not been reported.

If status is not NULL, wait4() stores status information in the location *status*. This status can be evaluated with the following macros:

**Note:** These macros take the status value (an int) as an argument -- not a pointer to the value!

#### WIFEXITED(status)

is nonzero if the child exited normally.

#### WEXITSTATUS(status)

evaluates to the least significant eight bits of the return code of the child that terminated, which may have been set as the argument to a call to exit() or as the argument for a return statement in the main program. This macro can only be evaluated if WIFEXITED() returned nonzero.

### WIFSIGNALED(status)

returns true if the child process exited because of a signal that was not caught.

#### WTERMSIG(status)

returns the number of the signal that caused the child process to terminate. This macro can only be evaluated if WIFSIGNALED() returned nonzero.

#### WIFSTOPPED(status)

returns true if the child process that caused the return is currently stopped; this is only possible if the call was done using WUNTRACED().

#### WSTOPSIG(status)

returns the number of the signal that caused the child to stop. This macro can only be evaluated if WIFSTOPPED() returned nonzero.

If *rusage* is not NULL, the struct rusage (as defined in sys/resource.h) that it points to will be filled with accounting information. See getrusage() for details.

### **Return Value**

On success, the process ID of the child that exited is returned. On error, -1 is returned (in particular, when no unwaited-for child processes of the specified kind exist), or 0 if WNOHANG() was used and no child was available yet. In the latter two cases, the global variable errno is set appropriately.

### **Errors**

#### **ECHILD**

No unwaited-for child process as specified does exist.

#### **ERESTARTSYS**

A WNOHANG() was not set and an unblocked signal or a SIGCHILD was caught. This error is returned by the system call. The library interface is not allowed to return ERESTARTSYS, but will return EINTR.

#### warn

### Name

warn — formatted error messages

# **Synopsis**

```
#include <err.h>
void warn (const char * fmt , ...);
```

# **Description**

The warn() function shall display a formatted error message on the standard error stream. The output shall consist of the last component of the program name, a colon character, and a space character. If fmt is non-NULL, it shall be used as a format string for the printf() family of functions, and the formatted message, a colon character, and a space are written to stderr. Finally, the error message string affiliated with the current value of the global variable errno shall be written to stderr, followed by a newline character.

### **Return Value**

None.

### **Errors**

None.

### warnx

### **Name**

warnx — formatted error messages

## **Synopsis**

```
#include <err.h>
void warnx (const char * fmt , ...);
```

## **Description**

The warnx() function shall display a formatted error message on the standard error stream. The last component of the program name, a colon character, and a space shall be output. If fmt is non-NULL, it shall be used as the format string for the printf() family of functions, and the formatted error message, a colon character, and a space shall be output. The output shall be followed by a newline character.

### **Return Value**

None.

### **Errors**

None.

### wcstoq

### Name

wcstoq — convert wide string to long long int representation

# **Synopsis**

```
#include <wchar.h>
long long int wcstoq(const wchar_t * restrict nptr, wchar_t **
restrict endptr, int base);
```

# Description

The wcstoq() function shall convert the initial portion of the wide string *nptr* to long long int representation. It is identical to wcstoll().

### **Return Value**

Refer to wcstoll().

### **Errors**

Refer to wcstoll().

### wcstouq

### **Name**

wcstouq — convert wide string to unsigned long long int representation

## **Synopsis**

```
#include <wchar.h>
unsigned long long wcstouq(const wchar_t * restrict nptr, wchar_t
** restrict endptr, int base);
```

## **Description**

The wcstouq() function shall convert the initial portion of the wide string *nptr* to unsigned long int representation. It is identical to wcstoull().

### **Return Value**

Refer to wcstoull().

### **Errors**

Refer to wcstoull().

### wscanf

### **Name**

wscanf — convert formatted input

## **Description**

The scanf() family of functions shall behave as described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except as noted below.

### **Differences**

The %s, %S and %[ conversion specifiers shall accept an option length modifier a, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set errno to ENOMEM and a conversion error results.

**Note:** This directly conflicts with the <u>ISO C (1999)</u> usage of %a as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as "%aseconds" will have a different meaning on an LSB conforming system.

### xdr\_u\_int

### **Name**

xdr\_u\_int — library routines for external data representation

## **Synopsis**

```
int xdr_u_int(XDR * xdrs, unsigned int * up);
```

## **Description**

xdr\_u\_int() is a filter primitive that translates between C unsigned integers and their external representations.

## **Return Value**

On success, 1 is returned. On error, 0 is returned.

### xdrstdio\_create

### Name

xdrstdio\_create — library routines for external data representation

## **Synopsis**

```
#include <rpc/xdr.h>
void xdrstdio_create(XDR * xdrs, FILE * file, enum xdr_op op);
```

## **Description**

The xdrstdio\_create() function shall initialize the XDR stream object referred to by xdrs. The XDR stream data shall be written to, or read from, the standard I/O stream associated with file. If the operation op is XDR\_ENCODE, encoded data shall be written to file. If op is XDR\_DECODE, encoded data shall be read from file. If op is XDR\_FREE, the XDR stream object may be used to deallocate storage allocated by a previous XDR\_DECODE.

The associated destroy function shall flush the file I/O stream, but not close it.

### Return Value

None.

### 14.6 Interfaces for libm

Table 14-38 defines the library name and shared object name for the library

### **Table 14-38 libm Definition**

Library:	libm
SONAME:	See architecture specific part.

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification

[SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

### 14.6.1 Math

### 14.6.1.1 Interfaces for Math

An LSB conforming implementation shall provide the generic functions for Math specified in <u>Table 14-39</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-39 libm - Math Function Interfaces**

### 14.7 Data Definitions for libm

This section defines global identifiers and their values that are associated with interfaces contained in libm. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

### 14.8 Interface Definitions for libm

The interfaces defined on the following pages are included in libm and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 14.6</u> shall behave as described in the referenced base document.

### finite

### **Name**

\_\_finite — test for infinity

## **Synopsis**

```
#include <math.h>
int __finite(double arg);
```

## **Description**

\_\_finite() has the same specification as isfinite() in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except that the argument type for \_\_finite() is known to be double

\_\_finite() is not in the source standard; it is only in the binary standard.

### \_\_finitef

### **Name**

\_\_finitef — test for infinity

## **Synopsis**

```
#include <math.h>
int __finitef(float arg);
```

## **Description**

\_\_finitef() has the same specification as isfinite() in <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>) except that the argument type for \_\_finitef() is known to be float.

\_\_finitef() is not in the source standard; it is only in the binary standard.

### finitel

### **Name**

```
__finitel — test for infinity
```

# **Synopsis**

```
#include <math.h>
int __finitel(long double arg);
```

# **Description**

\_\_finitel() has the same specification as isfinite() in the <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), except that the argument type for \_\_finitel() is known to be long double.

\_\_finitel() is not in the source standard; it is only in the binary standard.

## \_\_fpclassify

### **Name**

\_\_fpclassify — Classify real floating type

## **Synopsis**

int \_\_fpclassify(double arg);

## **Description**

\_\_fpclassify() has the same specification as fpclassify() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that the argument type for \_\_fpclassify() is known to be double.

\_\_fpclassify() is not in the source standard; it is only in the binary standard.

## \_\_fpclassifyf

### **Name**

\_\_fpclassifyf — Classify real floating type

## **Synopsis**

int \_\_fpclassifyf(float arg);

## **Description**

\_\_fpclassifyf() has the same specification as fpclassify() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that the argument type for \_\_fpclassifyf() is known to be float.

\_\_fpclassifyf() is not in the source standard; it is only in the binary standard.

# \_\_signbit

### **Name**

\_\_signbit — test sign of floating point value

# **Synopsis**

```
#include <math.h>
int __signbit(double arg);
```

# **Description**

\_\_signbit() has the same specification as signbit() in <u>POSIX 1003.1-2008</u> (<u>ISO/IEC 9945-2009</u>), except that the argument type for \_\_signbit() is known to be double.

\_\_signbit() is not in the source standard; it is only in the binary standard.

## \_\_signbitf

### **Name**

\_\_signbitf — test sign of floating point value

## **Synopsis**

```
#include <math.h>
int __signbitf(float arg);
```

## **Description**

\_\_signbitf() has the same specification as signbit() in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), except that the argument type for \_\_signbitf() is known to be float

\_\_signbitf() is not in the source standard; it is only in the binary standard.

## clog10

### **Name**

clog10 — Logarithm of a Complex Number

## **Synopsis**

```
#include <complex.h>
double complex clog10(double complex z);
```

## **Description**

The clog10() function shall compute the base 10 logarithm of the complex number z.

### **Return Value**

The clog10() function shall return the base 10 logarithm.

## clog10f

### **Name**

clog10f — Logarithm of a Complex Number

# **Synopsis**

```
#include <complex.h>
float complex clog10f(float complex z);
```

# **Description**

The clog10f() function shall compute the base 10 logarithm of the complex number z.

### **Return Value**

The clog10f() function shall return the base 10 logarithm.

## clog10l

### **Name**

clog101 — Logarithm of a Complex Number

## **Synopsis**

```
#include <complex.h>
long double complex clog101(long double complex z);
```

## **Description**

The clog10l() function shall compute the base 10 logarithm of the complex number z.

### **Return Value**

The clog101() function shall return the base 10 logarithm.

### drem

### Name

drem — Floating Point Remainder (DEPRECATED)

## **Synopsis**

```
#include <math.h>
double drem(double x, double y);
```

## **Description**

The drem() function shall return the floating point remainder, x REM y as required by IEC 60559/IEEE 754 Floating Point in the same way as remainder().

**Note:** This function is included only for backwards compatibility; applications should use remainder() instead.

### Returns

See remainder().

### See Also

remainder(), dremf(), dreml()

### dremf

### **Name**

dremf — Floating Point Remainder (DEPRECATED)

## **Synopsis**

```
#include <math.h>
double dremf(double x, double y);
```

## **Description**

The dremf() function shall return the floating point remainder, x REM y as required by IEC 60559/IEEE 754 Floating Point in the same way as remainderf().

**Note:** This function is included only for backwards compatibility; applications should use remainderf() instead.

### **Returns**

See remainderf().

### See Also

```
remainderf(), drem(), dreml()
```

### dreml

### **Name**

drem1 — Floating Point Remainder (DEPRECATED)

# **Synopsis**

```
#include <math.h>
double dreml(double x, double y);
```

# **Description**

The drem1() function shall return the floating point remainder, x REM y as required by IEC 60559/IEEE 754 Floating Point in the same way as remainder1().

**Note:** This function is included only for backwards compatibility; applications should use remainder1() instead.

### Returns

See remainder1().

### See Also

```
remainderl(), drem(), dremf()
```

## exp10

### **Name**

exp10 — Base-10 power function

## **Synopsis**

```
#include <math.h>
double exp10(double x);
```

## **Description**

The exp10() function shall return  $10^x$ .

**Note:** This function is identical to pow10().

### Returns

Upon successful completion, exp10() shall return 10 rised to the power of x.

If the correct value would cause overflow, a range error shall occur and exp10() shall return  $\pm HUGE\_VAL$ , with the same sign as the correct value of the function.

### See Also

```
pow10(), exp10f(), exp10l()
```

## exp10f

### **Name**

exp10f — Base-10 power function

# **Synopsis**

```
#include <math.h>
float exp10f(float x);
```

# **Description**

The explof() function shall return  $10^x$ .

**Note:** This function is identical to pow10f().

### Returns

Upon successful completion, explof() shall return 10 rised to the power of x.

If the correct value would cause overflow, a range error shall occur and explos() shall return  $\pm HUGE\_VALF$ , with the same sign as the correct value of the function.

### See Also

```
pow10f(), exp10(), exp10l()
```

396

### exp10l

#### **Name**

exp101 — Base-10 power function

## **Synopsis**

```
#include <math.h>
long double exp101(long double x);
```

## **Description**

The exp101() function shall return  $10^x$ .

**Note:** This function is identical to pow101().

#### Returns

Upon successful completion, exp101() shall return 10 rised to the power of x.

If the correct value would cause overflow, a range error shall occur and exp101() shall return ±HUGE\_VALL, with the same sign as the correct value of the function.

### See Also

```
pow101(), exp10(), exp10f()
```

### fedisableexcept

#### **Name**

fedisableexcept — disable floating point exceptions

# **Synopsis**

```
#include <fenv.h>
int fedisableexcept(int excepts);
```

# **Description**

The fedisableexcept() function disables traps for each of the exceptions represented by the mask excepts.

### **Return Value**

The fedisableexcept() function returns the previous set of enabled exceptions on success. On error, -1 is returned.

#### **Errors**

No errors are defined, but the function will fail if not supported on the architecture.

### feenableexcept

#### **Name**

feenableexcept — enable floating point exceptions

## **Synopsis**

```
#include <fenv.h>
int feenableexcept(int excepts);
```

## **Description**

The feenableexcept() function enables traps for each of the exceptions represented by the mask excepts.

### **Return Value**

The feenableexcept() function returns the previous set of enabled exceptions on success. On error, -1 is returned.

#### **Errors**

No errors are defined, but the function will fail if not supported on the architecture.

### fegetexcept

#### **Name**

fegetexcept — query floating point exception handling state

# **Synopsis**

```
#include <fenv.h>
int fegetexcept(void);
```

# **Description**

The fegetexcept() function returns the set of all currently enabled exceptions.

#### **Return Value**

The fegetexcept() function returns the set of all currently enabled exceptions.

#### **Errors**

No errors are defined, but the function will fail if not supported on the architecture.

#### finite

#### **Name**

finite — test for infinity (DEPRECATED)

# **Synopsis**

#define \_SVID\_SOURCE

```
#include <math.h>
int finite(double arg);
```

### **Description**

The finite() function shall test whether its argument is neither INFINITY nor not a number (NaN).

#### Returns

On success, finite() shall return 1. Otherwise the function shall return 0.

**Note:** The <u>ISO C (1999)</u> standard defines the function isfinite(), which is more general purpose. The finite() function is deprecated, and applications should use isfinite() instead. A future revision of this standard may remove this function.

#### See Also

```
isfinite(), finitef(), finitel()
```

#### finitef

#### **Name**

finitef — test for infinity (DEPRECATED)

## **Synopsis**

```
#define _SVID_SOURCE
#include <math.h>
int finitef(float arg);
```

## **Description**

The finitef() function shall test whether its argument is neither INFINITY nor not a number (NaN).

### **Returns**

On success, finitef() shall return 1. Otherwise the function shall return 0.

**Note:** The <u>ISO C (1999)</u> standard defines the function isfinite(), which is more general purpose. The finitef() function is deprecated, and applications should use isfinite() instead. A future revision of this standard may remove this function.

### See Also

```
isfinite(), finite(), finitel()
```

#### finitel

#### **Name**

finitel — test for infinity (DEPRECATED)

# **Synopsis**

#define \_SVID\_SOURCE

```
#include <math.h>
int finitel(long double arg);
```

## **Description**

The finitel() function shall test whether its argument is neither INFINITY nor not a number (NaN).

#### Returns

On success, finitel() shall return 1. Otherwise the function shall return 0.

**Note:** The <u>ISO C (1999)</u> standard defines the function isfinite(), which is more general purpose. The finitel() function is deprecated, and applications should use isfinite() instead. A future revision of this standard may remove this function.

#### See Also

```
isfinite(), finite(), finitef()
```

### gamma

#### **Name**

gamma — log gamma function (DEPRECATED)

## **Synopsis**

```
#include <math.h>
double gammaf(double x);
```

## **Description**

The gamma() function is identical to 1gamma() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

Note: The name gamma() for this function is deprecated and should not be used.

#### Returns

See lgamma().

### See Also

lgamma(), lgammaf(), lgammal(), gammaf(), gammal()

### gammaf

#### **Name**

gammaf — log gamma function (DEPRECATED)

## **Synopsis**

```
#include <math.h>
float gammaf(float x);
```

## **Description**

The gammaf() function is identical to lgammaf() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

**Note:** The name gammaf() for this function is deprecated and should not be used.

#### Returns

See lgammaf().

#### See Also

```
lgamma(), lgammaf(), lgammal(), gammal()
```

### gammal

#### Name

gammal — log gamma function (DEPRECATED)

# **Synopsis**

```
#include <math.h>
long double gammal(long double x);
```

# **Description**

The gammal() function is identical to lgammal() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

**Note:** The name gammal() for this function is deprecated and should not be used.

### **Returns**

See lgammal().

### See Also

lgamma(), lgammaf(), lgammal(), gammaf()

### j0f

#### **Name**

jof — Bessel functions

## **Synopsis**

```
#include <math.h>
float j0f(float x);
```

## **Description**

The j@f() function is identical to j@(), except that the argument x and the return value is a float.

### **Returns**

See j0().

#### See Also

```
j0(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(),
y1f(), y1l(), yn(), ynf(), ynl()
```

### j0I

### **Name**

j01 — Bessel functions

# **Synopsis**

```
#include <math.h>
long double j01(long double x);
```

# **Description**

The j@l() function is identical to j@(), except that the argument x and the return value is a long double.

#### Returns

See j0().

```
j0(), j0f(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(),
y1f(), y1l(), yn(), ynf(), ynl()
```

### j1f

#### Name

j1f — Bessel functions

## **Synopsis**

```
#include <math.h>
float j1f(float x);
```

### **Description**

The j1f() function is identical to j1(), except that the argument x and the return value is a float.

### **Returns**

See j1().

#### See Also

```
j0(), j0f(), j0l(), j1(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(),
y1f(), y1l(), yn(), ynf(), ynl()
```

## j1I

### **Name**

j11 — Bessel functions

# **Synopsis**

```
#include <math.h>
long double j11(long double x);
```

# **Description**

The j11() function is identical to j1(), except that the argument x and the return value is a long double.

### **Returns**

See j0().

```
j0(), j0f(), j0l(), j1(), j1f(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(),
y1f(), y1l(), yn(), ynf(), ynl()
```

### jnf

#### **Name**

jnf — Bessel functions

## **Synopsis**

```
#include <math.h>
float jnf(float x);
```

## **Description**

The jnf() function is identical to jn(), except that the argument x and the return value is a float.

### **Returns**

See jn().

#### See Also

```
j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnl(), y0(), y0f(), y0l(), y1(),
y1f(), y1l(), yn(), ynf(), ynl()
```

### jnl

### **Name**

jnl — Bessel functions

# **Synopsis**

```
#include <math.h>
long double jnl(long double x);
```

# **Description**

The jnl() function is identical to jn(), except that the argument x and the return value is a long double.

### **Returns**

See jn().

```
j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), y0(), y0f(), y0l(), y1(),
y1f(), y1l(), yn(), ynf(), ynl()
```

### Igamma\_r

#### Name

lgamma\_r — log gamma functions

## **Synopsis**

```
#include <math.h>
double lgamma_r(double x, int * signp);
```

## **Description**

The lgamma\_r() function shall compute the natural logarithm of the absolute value of the Gamma function, as lgamma(). However, instead of setting the external integer signgam to the sign of the Gamma function, lgamma\_r() shall set the integer referenced by signp to the sign.

#### **Returns**

See lgamma() and signgam.

#### See Also

```
lgamma(), lgammaf_r(), lgammal_r(), signgam
```

### lgammaf\_r

#### **Name**

lgammaf\_r — log gamma functions

# **Synopsis**

```
#include <math.h>
float lgammaf_r(float x, int * signp);
```

# **Description**

The <code>lgammaf\_r()</code> function shall compute the natural logarithm of the absolute value of the Gamma function, as <code>lgammaf()</code>. However, instead of setting the external integer <code>signgam</code> to the sign of the Gamma function, <code>lgammaf\_r()</code> shall set the integer referenced by <code>signp</code> to the sign.

#### Returns

See lgammaf() and signgam.

#### See Also

lgamma(), lgamma\_r(), lgammal\_r(), signgam

### Igammal\_r

#### **Name**

 $lgammal_r - log gamma functions$ 

## **Synopsis**

```
#include <math.h>
double lgammal_r(double x, int * signp);
```

## **Description**

The lgammal\_r() function shall compute the natural logarithm of the absolute value of the Gamma function, as lgammal(). However, instead of setting the external integer signgam to the sign of the Gamma function, lgammal\_r() shall set the integer referenced by signp to the sign.

#### Returns

See lgammal() and signgam.

#### See Also

```
lgamma(), lgamma_r(), lgammaf_r(), signgam
```

#### matherr

#### **Name**

matherr — math library exception handling

# **Synopsis**

```
#include <math.h>
int matherr(struct exception *__exc);
```

# **Description**

The System V Interface Definition (SVID) Issue 3 specifies that various math functions should invoke a function called matherr() if a math exception is detected. This function is called before the math function returns; after matherr() returns, the system then returns to the math function, which in turn returns to the caller.

matherr() is obsolete; indeed it was withdrawn in the System V Interface Definition (SVID) Issue 4, and is required only by this specification for historical compatibility, and will be removed in a future version. The floating point environment function group including fesetenv() should be used instead.

matherr() is not in the source standard; it is only in the binary standard.

### See Also

fesetenv(), fegetenv(), feupdateenv().

### pow10

#### **Name**

pow10 — Base-10 power function

## **Synopsis**

```
#include <math.h>
double pow10(double x);
```

## **Description**

The pow10() function shall return  $10^x$ .

**Note:** This function is identical to exp10().

### **Returns**

Upon successful completion, pow10() shall return 10 rised to the power of x.

If the correct value would cause overflow, a range error shall occur and pow10() shall return ±HUGE\_VAL, with the same sign as the correct value of the function.

### See Also

```
exp10(), pow10f(), pow10l()
```

### pow10f

### **Name**

pow10f — Base-10 power function

# **Synopsis**

```
#include <math.h>
float pow10f(float x);
```

# **Description**

The pow10f() function shall return  $10^x$ .

**Note:** This function is identical to exp10f().

#### Returns

Upon successful completion, pow10f() shall return 10 rised to the power of x.

If the correct value would cause overflow, a range error shall occur and pow10f() shall return  $\pm HUGE\_VALF$ , with the same sign as the correct value of the function.

```
exp10f(), pow10(), pow10l()
```

### pow10I

#### **Name**

pow101 — Base-10 power function

## **Synopsis**

```
#include <math.h>
long double pow101(long double x);
```

## **Description**

The pow101() function shall return  $10^x$ .

**Note:** This function is identical to exp101().

#### Returns

Upon successful completion, pow101() shall return 10 rised to the power of x.

If the correct value would cause overflow, a range error shall occur and pow101() shall return ±HUGE\_VALL, with the same sign as the correct value of the function.

### See Also

```
exp10l(), pow10(), pow10f()
```

#### scalbf

### Name

scalbf — load exponent of radix-independent floating point number

# **Synopsis**

```
#include <math.h>
float scalbf(float x, double exp);
```

# **Description**

The scalbf() function is identical to scalb(), except that the argument x and the return value is of type float.

### Returns

See scalb().

#### scalbl

#### **Name**

scalbl — load exponent of radix-independent floating point number

## **Synopsis**

```
#include <math.h>
long double scalbl(long double x, double exp);
```

## **Description**

The scalbl() function is identical to scalb(), except that the argument x and the return value is of type long double.

### **Returns**

See scalb().

### significand

#### **Name**

significand — floating point mantissa

# **Synopsis**

```
#include <math.h>
double significand(double x);
```

## Description

The significand() function shall return the mantissa of x, sig such that  $x \equiv \text{sig} \times 2^n$  scaled such that  $1 \leq \text{sig} < 2$ .

**Note:** This function is intended for testing conformance to <u>IEC 60559/IEEE 754 Floating Point</u>, and its use is not otherwise recommended.

This function is equivalent to scalb(x, (double)-ilogb(x)).

### **Returns**

Upon successful completion, significand() shall return the mantissa of x in the range  $1 \le sig < 2$ .

If x is 0, ±HUGE\_VAL, or NaN, the result is undefined.

```
significandf(), significandl()
```

## significandf

#### Name

significandf — floating point mantissa

# **Synopsis**

```
#include <math.h>
float significandf(float x);
```

## **Description**

The significandf() function shall return the mantissa of x, sig such that  $x \equiv \text{sig} \times 2^n$  scaled such that  $1 \leq \text{sig} < 2$ .

**Note:** This function is intended for testing conformance to <u>IEC 60559/IEEE 754 Floating Point</u>, and its use is not otherwise recommended.

This function is equivalent to scalb(x, (double)-ilogb(x)).

### Returns

Upon successful completion, significandf() shall return the mantissa of x in the range  $1 \le sig < 2$ .

If x is 0,  $\pm$ HUGE\_VALF, or NaN, the result is undefined.

### See Also

significand(), significandl()

### significandl

#### **Name**

significandl — floating point mantissa

## **Synopsis**

```
#include <math.h>
long double significandl(long double x);
```

## **Description**

The significand1() function shall return the mantissa of x, sig such that  $x \equiv \text{sig} \times 2^n$  scaled such that  $1 \leq \text{sig} < 2$ .

**Note:** This function is intended for testing conformance to <u>IEC 60559/IEEE 754 Floating Point</u>, and its use is not otherwise recommended.

This function is equivalent to scalb(x, (double)-ilogb(x)).

#### Returns

Upon successful completion, significandl() shall return the mantissa of x in the range  $1 \le sig < 2$ .

If x is 0,  $\pm$ HUGE\_VALL, or NaN, the result is undefined.

#### See Also

```
significand(), significandf()
```

#### sincos

#### **Name**

sincos — trigonometric functions

# **Synopsis**

```
#define _GNU_SOURCE
#include <math.h>
void sincos(double x, double * sin, double * cos);
```

# **Description**

The sincos() function shall calculate both the sine and cosine of x. The sine shall be stored in the location referenced by sin, and the cosine in the location referenced by cosine.

#### Returns

None. See sin() and cos() for possible error conditions.

```
cos(), sin(), sincosf(), sincosl()
```

#### sincosf

#### **Name**

sincosf — trigonometric functions

## **Synopsis**

```
#define _GNU_SOURCE
#include <math.h>
void sincosf(float x, float * sin, float * cos);
```

### **Description**

The sincosf() function shall calculate both the sine and cosine of x. The sine shall be stored in the location referenced by sin, and the cosine in the location referenced by cosine.

### **Returns**

None. See sin() and cos() for possible error conditions.

#### See Also

```
cos(), sin(), sincos(), sincosl()
```

#### sincosl

#### **Name**

sincosl — trigonometric functions

# **Synopsis**

```
#define _GNU_SOURCE
#include <math.h>
void sincosl(long double x, long double * sin, long double * cos);
```

# **Description**

The sincosl() function shall calculate both the sine and cosine of x. The sine shall be stored in the location referenced by sin, and the cosine in the location referenced by cosine.

### **Returns**

None. See sin() and cos() for possible error conditions.

```
cos(), sin(), sincos(), sincosl()
```

### y0f

#### Name

yof — Bessel functions

## **Synopsis**

```
#include <math.h>
float y0f(float x);
```

## **Description**

The y0f() function is identical to y0(), except that the argument x and the return value is a float.

### **Returns**

See y0().

### See Also

```

```

## y0l

### **Name**

y01 — Bessel functions

# **Synopsis**

```
#include <math.h>
long double y01(long double x);
```

# **Description**

The y01() function is identical to y0(), except that the argument x and the return value is a long double.

### **Returns**

See y0().

```
j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y1(),
y1f(), y1l(), yn(), ynf(), ynl()
```

### y1f

#### **Name**

y1f — Bessel functions

## **Synopsis**

```
#include <math.h>
float y1f(float x);
```

## **Description**

The y1f() function is identical to y1(), except that the argument x and the return value is a float.

### **Returns**

See y1().

#### See Also

```
j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(),

```

# y1I

### **Name**

y11 — Bessel functions

# **Synopsis**

```
#include <math.h>
long double y11(long double x);
```

# **Description**

The y11() function is identical to y1(), except that the argument x and the return value is a long double.

### **Returns**

See j0().

```
j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(),
y0l(), y1(), y1f(), yn(), ynf(), ynl()
```

### ynf

#### **Name**

ynf — Bessel functions

## **Synopsis**

```
#include <math.h>
float ynf(float x);
```

## **Description**

The ynf() function is identical to yn(), except that the argument x and the return value is a float.

#### **Returns**

See yn().

#### See Also

```
j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(),
y0l(), y1(), y1f(), y1l(), yn(), ynl()
```

### ynl

### **Name**

ynl — Bessel functions

# **Synopsis**

```
#include <math.h>
long double ynl(long double x);
```

# **Description**

The ynl() function is identical to yn(), except that the argument x and the return value is a long double.

### **Returns**

See yn().

#### See Also

```
j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(),
y0l(), y1f(), y1l(), yn(), ynf()

### 14.9 Interfaces for libpthread

Table 14-42 defines the library name and shared object name for the library

**Table 14-42 libpthread Definition** 

Library:	libpthread
SONAME:	libpthread.so.0

The behavior of the interfaces in this library is specified by the following specifications:

[LFS] Large File Support

[LSB] This Specification

[SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

#### 14.9.1 Realtime Threads

#### 14.9.1.1 Interfaces for Realtime Threads

An LSB conforming implementation shall provide the generic functions for Realtime Threads specified in <u>Table 14-43</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-43 libpthread - Realtime Threads Function Interfaces

tubic 14 45 hopein cua Realtime 1 in cuas 1 unction interfaces

pwrite [SUSv4]	pwrite64 [LSB]		

### 14.9.5 GNU Extensions for libpthread

#### 14.9.5.1 Interfaces for GNU Extensions for libpthread

An LSB conforming implementation shall provide the generic functions for GNU Extensions for libpthread specified in <u>Table 14-48</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-48 libpthread - GNU Extensions for libpthread Function Interfaces

pthread_getattr_np [LSB]	pthread_mutex_co nsistent_np [LSB]	pthread_mutexattr _getrobust_np [LSB]	pthread_mutexattr _setrobust_np [LSB]
pthread_rwlockatt r_getkind_np [LSB]	pthread_rwlockatt r_setkind_np [LSB]		

# 14.9.6 System Calls

#### 14.9.6.1 Interfaces for System Calls

An LSB conforming implementation shall provide the generic functions for System Calls specified in <u>Table 14-49</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-49 libpthread - System Calls Function Interfaces

close [SUSv4]	fentl [LSB]	fork [SUSv4]	fsync [SUSv4]
lseek [SUSv4]	msync [SUSv4]	nanosleep [SUSv4]	open [SUSv4]

pause [SUSv4]	read [SUSv4]	vfork [SUSv3]	wait [SUSv4]
waitpid [LSB]	write [SUSv4]		

### 14.9.7 Standard I/O

#### 14.9.7.1 Interfaces for Standard I/O

An LSB conforming implementation shall provide the generic functions for Standard I/O specified in <u>Table 14-50</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-50 libpthread - Standard I/O Function Interfaces

O		
flockfile SUSv4		
TIOCKITIC DODY		

# 14.9.8 Signal Handling

### 14.9.8.1 Interfaces for Signal Handling

An LSB conforming implementation shall provide the generic functions for Signal Handling specified in <u>Table 14-51</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-51 libpthread - Signal Handling Function Interfaces** 

libc_current_sig rtmax [LSB]	libc_current_sig rtmin [LSB]	raise [SUSv4]	sigaction [SUSv4]
siglongjmp [SUSv4]	sigwait [SUSv4]		

### 14.9.9 Standard Library

### 14.9.9.1 Interfaces for Standard Library

An LSB conforming implementation shall provide the generic functions for Standard Library specified in <u>Table 14-52</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-52 libpthread - Standard Library Function Interfaces

errno_location [LSB]	ftrylockfile [SUSv4]	funlockfile [SUSv4]	longjmp [SUSv4]
system [LSB]			

### 14.9.10 Socket Interface

#### 14.9.10.1 Interfaces for Socket Interface

An LSB conforming implementation shall provide the generic functions for Socket Interface specified in <u>Table 14-53</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-53 libpthread - Socket Interface Function Interfaces** 

h_errno_locatio n [LSB]	accept [SUSv4]	connect [SUSv4]	recv [SUSv4]
recvfrom [SUSv4]	recvmsg [SUSv4]	send [SUSv4]	sendmsg [SUSv4]
sendto [SUSv4]			

#### 14.9.11 Terminal Interface Functions

#### 14.9.11.1 Interfaces for Terminal Interface Functions

An LSB conforming implementation shall provide the generic functions for Terminal Interface Functions specified in <u>Table 14-54</u>, with the full mandatory functionality as described in the referenced underlying specification.

### 14.10 Data Definitions for libpthread

This section defines global identifiers and their values that are associated with interfaces contained in libpthread. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

## 14.10.1 lsb/pthread.h

typedef unsigned long int pthread\_t;

```

### 14.11 Interface Definitions for libpthread

The interfaces defined on the following pages are included in libpthread and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 14.9</u> shall behave as described in the referenced base document.

### \_pthread\_cleanup\_pop

#### Name

\_pthread\_cleanup\_pop — establish cancellation handlers

# **Synopsis**

```
#include <pthread.h>
void _pthread_cleanup_pop(struct _pthread_cleanup_buffer *, int);
```

# **Description**

The \_pthread\_cleanup\_pop() function provides an implementation of the pthread\_cleanup\_pop() macro described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

The \_pthread\_cleanup\_pop() function is not in the source standard; it is only in the binary standard.

## \_pthread\_cleanup\_push

### Name

\_pthread\_cleanup\_push — establish cancellation handlers

# **Synopsis**

```
#include <pthread.h>
void _pthread_cleanup_push(struct _pthread_cleanup_buffer *, void
(*) (void *), void *);
```

# **Description**

The \_pthread\_cleanup\_push() function provides an implementation of the pthread\_cleanup\_push() macro described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

The \_pthread\_cleanup\_push() function is not in the source standard; it is only in the binary standard.

### pthread\_getattr\_np

#### Name

pthread\_getattr\_np — get thread attributes

## **Synopsis**

```
#include <pthread.h>
int pthread_getattr_np(pthread_t thread, pthread_attr_t *attr);
```

### **Description**

pthread\_getattr\_np() fills in the thread attribute object attr with attribute values describing the running thread thread. This is useful to detect runtime changes from the values specified in the thread attributes object used to create the thread with pthread\_create(). The following differences may be noted:

- The detach state, since a joinable thread may have detached itself after creation. Use pthread\_attr\_getdetachstate() to extract from attr.
- The stack size, which the implementation may align to a suitable boundary. Use pthread\_attr\_getstack() to extract from attr.
- The guard size, which the implementation may round upwards to a multiple of the page size, or ignore (i.e., treat as 0), if the application is allocating its own stack. Use pthread\_attr\_getguardsize() to extract from attr.

If the stack address attribute was not set in the thread attributes object used to create the thread, then the thread attributes object returned by pthread\_getattr\_np() will show the actual stack address the implementation selected for the thread. Use pthread\_attr\_getstack() to extract from attr.

The thread attributes object *attr* should be destroyed using pthread\_attr\_destroy() when it is no longer needed.

#### **Return Value**

On success, pthread\_getattr\_np() returns 0; on error, it returns a non-zero error number.

#### **Errors**

#### **ENOMEM**

Insufficient memory to complete the operation.

In addition, if *thread* refers to the main thread, then pthread\_getattr\_np() may also fail due to errors from various underlying calls: fopen(), if the pseudo-file containing the memory region map cannot be opened; getrlimit() if the RLIMIT\_STACK resource limit it not supported.

#### **Notes**

This function is a GNU extension.

#### See Also

### pthread\_mutex\_consistent\_np

#### **Name**

pthread\_mutex\_consistent\_np — mark state protected by robust mutex as
consistent

## **Synopsis**

```
#include <pthread.h>
int pthread_mutex_consistent_np(pthread_mutex_t * __mutex);
```

# **Description**

pthread\_mutex\_consistent\_np() shall behave as described for pthread\_mutex\_consistent() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

## pthread\_mutexattr\_getrobust\_np, pthread\_mutexattr\_setrobust\_np

#### **Name**

```
pthread_mutexattr_getrobust_np,
pthread_mutexattr_setrobust_np — get and set the mutex robust attribute
```

## **Synopsis**

# **Description**

pthread\_mutexattr\_setrobust\_np() shall behave as described for pthread\_mutexattr\_setrobust() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

pthread\_mutexattr\_getrobust\_np() shall behave as described for pthread\_mutexattr\_getrobust() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

Two additional valid values are defined for <u>\_\_robustness</u>: PTHREAD\_MUTEX\_STALLED\_NP, which is identical to PTHREAD\_MUTEX\_STALLED and PTHREAD MUTEX ROBUST NP, which is identical to PTHREAD MUTEX ROBUST.

### pthread\_rwlockattr\_getkind\_np, pthread\_rwlockattr\_setkind\_np

### **Name**

pthread\_rwlockattr\_getkind\_np, pthread\_rwlockattr\_setkind\_np — get/set the read-write lock kind of the thread read-write lock attribute object

## **Synopsis**

```
#include <pthread.h>
int pthread_rwlockattr_getkind_np(const pthread_rwlockattr_t * attr,
int * pref);
int pthread_rwlockattr_setkind_np(pthread_rwlockattr_t * attr, int *
pref);
```

### **Description**

The pthread\_rwlockattr\_setkind\_np() function sets the kind of read-write lock of the thread read-write lock attribute object referred to by attr to the value specified with pref. The argument pref may be set to PTHREAD\_RWLOCK\_PREFER\_READER\_NP, PTHREAD\_RWLOCK\_PREFER\_WRITER\_NONRECURSIVE\_NP, PTHREAD\_RWLOCK\_PREFER\_WRITER\_NP. The default lock setting is PTHREAD\_RW-LOCK\_PREFER\_READER\_NP. A thread may hold multiple read locks, i.e. read locks are recursive. According to The Single Unix Specification, the behavior is unspecified when a reader tries to place a lock, and there is no write lock but writers are waiting. Giving preference to the reader, as is set by default PTHREAD\_RWLOCK\_PREFER\_READER\_NP value implies that the reader will receive the requested lock, even if a writer is waiting. As long as there are readers the writer will be starved. Setting the kind to PTHREAD\_RWLOCK\_PREFER\_WRITER\_NONRECURSIVE\_NP, avoids writer starvation as long as any read locking is not done in a recursive fashion. The pthread\_rwlockattr\_getkind\_np() function returns the value of the readwrite lock attribute of the thread read-write lock attribute object referred to by attr in the pointer pref.

### **Return Value**

pthread\_rwlockattr\_setkind\_np() function returns 0 on success; on error, it returns a non-zero error number. pthread\_rwlockattr\_setkind\_np() function always returns 0.

#### **Errors**

**EINVAL** 

pref is set to an unsupported value.

#### **Notes**

Setting the value read-write lock kind to PTHREAD\_RWLOCK\_PREFER\_WRITER\_NP, results in the same behavior as setting the value to PTHREAD\_RWLOCK\_PREFER\_READER\_NP. As long as a reader thread holds the lock the thread holding a write lock will be starved. Setting the kind value to PTHREAD\_RWLOCK\_PREFER\_WRITER\_NONRECURSIVE\_NP, allows the writer to run. However, the writer may not be recursive as is implied by the name.

### waitpid

#### **Name**

waitpid — wait for child process

## **Description**

waitpid() is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

#### Need not support wcontinued or wifcontinued

Implementations need not support the XSI optional functionality of WCONTINUED() or WIFCONTINUED().

### 14.12 Interfaces for libgcc\_s

<u>Table 14-55</u> defines the library name and shared object name for the libgcc\_s library

Table 14-55 libgcc\_s Definition

Library:	libgcc_s
SONAME:	libgcc_s.so.1

The behavior of the interfaces in this library is specified by the following specifications: [LSB] This Specification

## 14.12.1 Unwind Library

### 14.12.1.1 Interfaces for Unwind Library

An LSB conforming implementation shall provide the generic functions for Unwind Library specified in <u>Table 14-56</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-56 libgcc\_s - Unwind Library Function Interfaces

# 14.13 Data Definitions for libgcc\_s

This section defines global identifiers and their values that are associated with interfaces contained in libgcc\_s. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

## 14.14 Interface Definitions for libgcc\_s

The interfaces defined on the following pages are included in libgcc\_s and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 14.12</u> shall behave as described in the referenced base document.

## \_Unwind\_Backtrace

#### **Name**

\_Unwind\_Backtrace — private C++ error handling method

# **Synopsis**

\_Unwind\_Reason\_Code \_Unwind\_Backtrace(\_Unwind\_Trace\_Fn trace, void \* trace\_argument);

# **Description**

\_Unwind\_Backtrace() performs a stack backtrace using unwind data. The *trace* callback is called for every stack frame in the call chain. No cleanup actions are performed.

### \_Unwind\_DeleteException

### **Name**

 $\verb|_Unwind_DeleteException| -- private C++ error handling method|$ 

# **Synopsis**

void \_Unwind\_DeleteException(struct \_Unwind\_Exception \* object);

# **Description**

\_Unwind\_DeleteException() deletes the given exception *object*. If a given runtime resumes normal execution after catching a foreign exception, it will not know how to delete that exception. Such an exception shall be deleted by calling \_Unwind\_DeleteException(). This is a convenience function that calls the function pointed to by the *exception\_cleanup* field of the exception header.

# \_Unwind\_FindEnclosingFunction

### **Name**

\_Unwind\_FindEnclosingFunction — private C++ error handling method

# **Synopsis**

void \* \_Unwind\_FindEnclosingFunction(void \* ip);

# **Description**

\_Unwind\_FindEnclosingFunction() Find the start address of the procedure containing the specified *ip* or NULL if it cannot be found (for example, because the function has no unwind info).

Note that there is not necessarily a one-to-one correspondence between source level functions and procedures. Some functions do not have unwind-info and others are split into multiple procedures.

### \_Unwind\_ForcedUnwind

### **Name**

\_Unwind\_ForcedUnwind — private C++ error handling method

# **Synopsis**

```
#include <unwind.h>
_Unwind_Reason_Code _Unwind_ForcedUnwind(struct _Unwind_Exception *
object, _Unwind_Stop_Fn stop, void * stop_parameter);
```

## **Description**

Forced unwinding is a single-phase process. *stop* and *stop\_parameter* control the termination of the unwind process instead of the usual personality routine query. Stop function *stop* is called for each unwind frame, with the parameteres described for the usual personality routine below, plus an additional *stop\_parameter*.

### **Return Value**

When *stop* identifies the destination frame, it transfers control to the user code as appropriate without returning, normally after calling \_Unwind\_DeleteException(). If not, then it should return an \_Unwind\_Reason\_Code value.

If *stop* returns any reason code other than \_URC\_NO\_REASON, then the stack state is indeterminate from the point of view of the caller of \_Unwind\_ForcedUnwind(). Rather than attempt to return, therefore, the unwind library should use the *exception\_cleanup* entry in *object*, and then call abort().

#### \_URC\_NO\_REASON

This is not the destination from. The unwind runtime will call frame's personality routine with the \_UA\_FORCE\_UNWIND and \_UA\_CLEANUP\_PHASE flag set in *actions*, and then unwind to the next frame and call the stop() function again.

#### URC END OF STACK

In order to allow \_Unwind\_ForcedUnwind() to perform special processing when it reaches the end of the stack, the unwind runtime will call it after the last frame is rejected, with a NULL stack pointer in the context, and the STOP() FUNCTION SHALL CATCH THIS CONDITION. iT MAY return this code if it cannot handle end-of-stack.

#### URC FATAL PHASE2 ERROR

The stop() function may return this code for other fatal conditions like stack corruption.

### \_Unwind\_GetCFA

### **Name**

\_Unwind\_GetCFA — private C++ error handling method

# **Synopsis**

```
_Unwind_Word _Unwind_GetCFA(struct _Unwind_Context * context);
```

# **Description**

\_Unwind\_GetCFA() shall retrieve the value of the Canonical Frame Address (CFA) of the given <code>context</code>.

### **Unwind GetGR**

### **Name**

\_Unwind\_GetGR — private C++ error handling method

# **Synopsis**

```
_Unwind_Word _Unwind_GetGR(struct _Unwind_Context * context, int index);
```

# **Description**

\_Unwind\_GetGR() returns data at *index* found in *context*. The register is identified by its index: 0 to 31 are for the fixed registers, and 32 to 127 are for the stacked registers.

During the two phases of unwinding, only GR1 has a guaranteed value, which is the global pointer of the frame referenced by the unwind *context*. If the register has its NAT bit set, the behavior is unspecified.

# \_Unwind\_GetIP

### **Name**

\_Unwind\_GetIP — private C++ error handling method

# **Synopsis**

```
_Unwind_Ptr _Unwind_GetIP(struct _Unwind_Context * context);
```

# **Description**

\_Unwind\_GetIP() returns the instruction pointer value for the routine identified by the unwind *context*.

### \_Unwind\_GetIPInfo

### **Name**

\_Unwind\_GetIPInfo — private C++ error handling method

# **Synopsis**

```
_Unwind_Ptr _Unwind_GetiPinfo(struct _Unwind_Context * context, int * ip_before_insn);
```

# **Description**

\_Unwind\_GetIPInfo() returns the instruction pointer value for the routine identified by the unwind *context* and sets *ip\_before\_insn* flag indicating whether that IP is before or after first not yet fully executed instruction.

## \_Unwind\_GetLanguageSpecificData

#### **Name**

\_Unwind\_GetLanguageSpecificData — private C++ error handling method

# **Synopsis**

```
#include <unwind.h>
_Unwind_Ptr _Unwind_GetLanguageSpecificData(struct _Unwind_Context *
context);
```

# **Description**

\_Unwind\_GetLanguageSpecificData() returns the address of the language specific data area for the current stack frame described by *context*.

# \_Unwind\_GetRegionStart

### **Name**

\_Unwind\_GetRegionStart — private C++ error handling method

# **Synopsis**

```
_Unwind_Ptr _Unwind_GetRegionStart(struct _Unwind_Context * context);
```

# **Description**

\_Unwind\_GetRegionStart() routine returns the address (i.e., 0) of the beginning of the procedure or code fragment described by the current unwind descriptor block.

## \_Unwind\_RaiseException

#### **Name**

\_Unwind\_RaiseException — private C++ error handling method

# **Synopsis**

\_Unwind\_Reason\_Code \_Unwind\_RaiseException(struct \_Unwind\_Exception \* object);

# **Description**

\_Unwind\_RaiseException() raises an exception, passing along the given exception object, which should have its exception\_class and exception\_cleanup fields set. The exception object has been allocated by the language-specific runtime, and has a language-specific format, exception that it shall contain an \_Unwind\_Exception.

### **Return Value**

\_Unwind\_RaiseException() does not return unless an error condition is found. If an error condition occurs, an \_Unwind\_Reason\_Code is returnd:

#### \_URC\_END\_OF\_STACK

The unwinder encountered the end of the stack during phase one without finding a handler. The unwind runtime will not have modified the stack. The C++ runtime will normally call uncaught\_exception() in this case.

#### \_URC\_FATAL\_PHASE1\_ERROR

The unwinder encountered an unexpected error during phase one, because of something like stack corruption. The unwind runtime will not have modified the stack. The C++ runtime will normally call terminate() in this case.

#### URC FATAL PHASE2 ERROR

The unwinder encountered an unexpected error during phase two. This is usually a *throw*, which will call terminate().

### \_Unwind\_Resume

#### **Name**

\_Unwind\_Resume — private C++ error handling method

# **Synopsis**

void \_Unwind\_Resume(struct \_Unwind\_Exception \* object);

# **Description**

\_Unwind\_Resume() resumes propagation of an existing exception *object*. A call to this routine is inserted as the end of a landing pad that performs cleanup, but does not resume normal execution. It causes unwinding to proceed further.

### \_Unwind\_Resume\_or\_Rethrow

### **Name**

\_Unwind\_Resume\_or\_Rethrow — private C++ error handling method

# **Synopsis**

# **Description**

If the unwind was initiated due to a forced unwind, \_Unwind\_Resume\_or\_Rethrow() shall resume that operation, else it shall re-raise the exception.

### \_Unwind\_SetGR

#### Name

\_Unwind\_SetGR — private C++ error handling method

## **Synopsis**

void \_Unwind\_SetGR(struct \_Unwind\_Context \* context, int index, uint
value);

# **Description**

\_Unwind\_SetGR() sets the *value* of the register *index*ed for the routine identified by the unwind *context*.

## \_Unwind\_SetIP

#### Name

\_Unwind\_SetIP — private C++ error handling method

# **Synopsis**

```
#include <unwind.h>
void _Unwind_SetIP(struct _Unwind_Context * context, _Unwind_Ptr
value);
```

# **Description**

\_Unwind\_SetIP() sets the instruction pointer for the routine identified by the unwind context to value.

#### 14.15 Interfaces for libdl

Table 14-57 defines the library name and shared object name for the libdl library

#### **Table 14-57 libdl Definition**

Library:	libdl
SONAME:	libdl.so.2

The behavior of the interfaces in this library is specified by the following specifications: [LSB] This Specification

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

## 14.15.1 Dynamic Loader

### 14.15.1.1 Interfaces for Dynamic Loader

An LSB conforming implementation shall provide the generic functions for Dynamic Loader specified in <u>Table 14-58</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-58 libdl - Dynamic Loader Function Interfaces

dladdr [LSB]	dlclose [SUSv4]	dlerror [SUSv4]	dlopen [LSB]
dlsym [LSB]	dlvsym [LSB]		

#### 14.16 Data Definitions for libdl

This section defines global identifiers and their values that are associated with interfaces contained in libdl. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

#### 14.16.1 dlfcn.h

```
#define RTLD_NEXT
                             ((void *) -11)
#define RTLD_DEFAULT
                             ((void *) 0)
#define RTLD_LOCAL
#define RTLD_LAZY
                            0x00001
#define RTLD_NOW
                            0 \times 00002
#define RTLD NOLOAD
                            0x00004
#define RTLD_DEEPBIND
                            0x00008
#define RTLD_GLOBAL
                            0x00100
#define RTLD NODELETE
                            0x01000
typedef struct {
    char *dli fname;
    void *dli_fbase;
    char *dli_sname;
    void *dli_saddr;
} Dl_info;
extern int dladdr(const void *__address, Dl_info * __info);
extern int dlclose(void *__handle);
extern char *dlerror(void);
extern void *dlopen(const char *__file, int __mode);
extern void *dlsym(void *__handle, const char *__name);
extern void *dlvsym(void *handle, const char *name, const char
*version);
```

### 14.17 Interface Definitions for libdl

The interfaces defined on the following pages are included in libdl and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 14.15</u> shall behave as described in the referenced base document.

### dladdr

### Name

dladdr — find the shared object containing a given address

# **Synopsis**

```
} Dl_info;
int dladdr(const void * addr, Dl_info * dlip);
```

## **Description**

The dladdr() function shall query the dynamic linker for information about the shared object containing the address *addr*. The information shall be returned in the user supplied data structure referenced by *dlip*.

The structure shall contain at least the following members:

dli fname

The pathname of the shared object containing the address

dli\_fbase

The base address at which the shared object is mapped into the address space of the calling process.

dli\_sname

The name of the nearest runtime symbol with value less than or equal to *addr*. Where possible, the symbol name shall be returned as it would appear in C source code.

If no symbol with a suitable value is found, both this field and dli\_saddr shall be set to NULL.

dli\_saddr

The address of the symbol returned in *dli\_sname*. This address has type "pointer to *type*", where *type* is the type of the symbol *dli\_sname*.

**Example:** If the symbol in *dli\_sname* is a function, then the type of *dli\_saddr* is of type "pointer to function".

The behavior of dladdr() is only specified in dynamically linked programs.

### **Return Value**

On success, dladdr() shall return non-zero, and the structure referenced by dlip shall be filled in as described. Otherwise, dladdr() shall return zero, and the cause of the error can be fetched with dlerror().

### **Errors**

See dlerror().

### **Environment**

LD\_LIBRARY\_PATH

directory search-path for object files

### dlopen

#### **Name**

dlopen — open dynamic object

# **Synopsis**

```
#include <dlfcn.h>
void * dlopen(const char * filename, int flag);
```

# **Description**

The dlopen() function shall behave as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with additional behaviors listed below.

If the file argument does not contain a <slash> character, then the system shall look for a library of that name in at least the following directories, and use the first one which is found:

- The directories specified by the DT\_RPATH dynamic entry.
- The directories specified in the LD\_LIBRARY\_PATH environment variable (which is a colon separated list of pathnames). This step shall be skipped for setuid and setgid executables.
- A set of directories sufficient to contain the libraries specified in this standard.

**Note:** Traditionally, /lib and /usr/lib. This case would also cover cases in which the system used the mechanism of /etc/ld.so.conf and /etc/ld.so.cache to provide access.

Example: An application which is not linked against libm may choose to dlopen libm.

#### **Additional flags**

In addition to the available values for *flag* as documented in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), the following values may also be ORed into *flag*:

#### RTLD\_NODELETE

Do not unload the library during dlclose(). Consequently, the library's static variables are not reinitialized if the library is reloaded with dlopen() at a later time.

#### RTLD\_NOLOAD

Do not load the library. This can be used to test if the library is already resident. dlopen() returns a NULL pointer if it is not resident; it returns the library's handle if it is resident. This flag can also be used to promote the flags on a library that is already loaded. For example, a library that was previously loaded with RTLD\_LOCAL can be reopened using RTLD\_NOLOAD|RTLD\_GLOBAL.

#### RTLD\_DEEPBIND

Place the lookup scope of the symbols in this library ahead of the global scope. This means that a self-contained library will use its own symbols in preference to global symbols with the same name contained in libraries that have already been loaded.

## dlsym

#### **Name**

dlsym — obtain the address of a symbol from a dlopen object

# **Description**

dlsym() is as specified in the <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### RTLD\_NEXT, RTLD\_DEFAULT Required

The values RTLD\_NEXT and RTLD\_DEFAULT, described as reserved for future use in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, are required, with behavior as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

## dlvsym

### **Name**

dlvsym — obtain the address of a symbol from a dlopen object

# **Synopsis**

```
#include <dlfcn.h>
void * dlvsym(void * handle, char * name, char * version);
```

# **Description**

dlvsym() does the same as dlsym() but takes a version string as an additional argument.

#### 14.18 Interfaces for librt

Table 14-59 defines the library name and shared object name for the library

#### **Table 14-59 librt Definition**

Library:	librt
SONAME:	librt.so.1

The behavior of the interfaces in this library is specified by the following specifications: [LFS] <u>Large File Support</u>

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

# 14.18.1 Shared Memory Objects

### 14.18.1.1 Interfaces for Shared Memory Objects

An LSB conforming implementation shall provide the generic functions for Shared Memory Objects specified in <u>Table 14-60</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-60 librt - Shared Memory Objects Function Interfaces** 

chm onon	shm unlink	
shm_open	shm_unlink

### 14.18.3 Clock

#### 14.18.3.1 Interfaces for Clock

An LSB conforming implementation shall provide the generic functions for Clock specified in <u>Table 14-62</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-62 librt - Clock Function Interfaces** 

clock_getcpuclock id [SUSv4]	clock_getres [SUSv4]	clock_gettime [SUSv4]	clock_nanosleep [SUSv4]
clock_settime [SUSv4]			

### 14.18.4 Timers

#### 14.18.4.1 Interfaces for Timers

An LSB conforming implementation shall provide the generic functions for Timers specified in <u>Table 14-63</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-63 librt - Timers Function Interfaces** 

timer_create [SUSv4]	timer_delete [SUSv4]	timer_getoverrun [SUSv4]	timer_gettime [SUSv4]
timer_settime [SUSv4]			

# 14.18.5 Message Queues

### 14.18.5.1 Interfaces for Message Queues

An LSB conforming implementation shall provide the generic functions for Message Queues specified in <u>Table 14-64</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-64 librt - Message Queues Function Interfaces** 

mq_close(GLIBC	mq_getattr(GLIB	mq_notify(GLIBC	mq_open(GLIBC_
2.3.4) [SUSv4]	C 2.3.4) [SUSv4]	2.3.4) [SUSv4]	2.3.4) [SUSv4]

mq_receive(GLIB C_2.3.4) [SUSv4]	mq_send(GLIBC_ 2.3.4) [SUSv4]	mq_setattr(GLIBC _2.3.4) [SUSv4]	mq_timedreceive( GLIBC_2.3.4) [SUSv4]
mq_timedsend(GL IBC_2.3.4) [SUSv4]	mq_unlink(GLIB C_2.3.4) [SUSv4]		

#### 14.19 Data Definitions for librt

This section defines global identifiers and their values that are associated with interfaces contained in librt. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

### 14.19.1 aio.h

```
#define AIO_CANCELED
#define AIO_NOTCANCELED 1
#define AIO_ALLDONE
#define LIO_READ

### 14.20 Interfaces for libcrypt

Table 14-65 defines the library name and shared object name for the library

**Table 14-65 libcrypt Definition** 

Library:	liberypt
SONAME:	liberypt.so.1

The behavior of the interfaces in this library is specified by the following specifications: [LSB] This Specification

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

# 14.20.1 Encryption

#### 14.20.1.1 Interfaces for Encryption

An LSB conforming implementation shall provide the generic functions for Encryption specified in <u>Table 14-66</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 14-66 libcrypt - Encryption Function Interfaces** 

crypt [SUSv4]	crypt_r [LSB]	encrypt [SUSv4]	encrypt_r [LSB]
setkey [SUSv4]	setkey_r [LSB]		

## 14.21 Data Definitions for libcrypt

This section defines global identifiers and their values that are associated with interfaces contained in libcrypt. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

# 14.21.1 crypt.h

```
struct crypt_data {
    char keysched[128];
    char sb0[32768];
    char sb1[32768];
    char sb2[32768];
    char sb3[32768];
    char crypt_3_buf[14];
    char current_salt[2];
    long int current_saltbits;
    int direction;
    int initialized;
};
extern char *crypt_r(const char *key, const char *salt,
```

#### LSB Core - Generic 5.0

## 14.22 Interface Definitions for libcrypt

The interfaces defined on the following pages are included in libcrypt and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 14.20</u> shall behave as described in the referenced base document.

### crypt\_r

### **Name**

crypt\_r — Cryptographic string encoding function

# **Synopsis**

```
#include <crypt.h>
char * crypt_r(const char * key, const char * salt, struct
crypt_data * data);
```

# Description

The crypt\_r() function is a re-entrant version of the crypt() function. crypt\_r() shall behave as specified for crypt() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with an additional parameter, a pointer to a structure which is used to store result data and bookkeeping information.

The caller should set the *initialized* field of the crypt\_data structure to zero before the first call to crypt\_r().

### **Notes**

**INSERT TEXT HERE** 

### See Also

crypt(), setkey\_r(), encrypt\_r().

### encrypt\_r

#### **Name**

encrypt\_r — Cryptographic encoding function

# **Synopsis**

```
#include <crypt.h>
void encrypt_r(const char * block, int edflag, struct crypt_data *
data);
```

## **Description**

The encrypt\_r() function is a re-entrant version of the encrypt() function. encrypt\_r() shall behave as specified for encrypt() in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with an additional parameter, a pointer to a structure which is used to store result data and bookkeeping information.

### **Notes**

INSERT TEXT HERE

### See Also

```
encrypt(), crypt_r(), setkey_r().
```

# setkey\_r

### **Name**

setkey\_r — Set cryptographic encoding key

# **Synopsis**

```
#include <crypt.h>
void setkey_r(const char * key, struct crypt_data * data);
```

# **Description**

The setkey\_r() function is a re-entrant version of the setkey() function. setkey\_r() shall behave as specified for setkey() in  $\underline{POSIX\ 1003.1-2008\ (ISO/IEC\ 9945-2009)}$ , but with an additional parameter, a pointer to a structure which is used to store result data and bookkeeping information.

The caller should set the *initialized* field of the crypt\_data structure to zero before the first call to setkey\_r().

#### **Notes**

# 14.23 Interfaces for libpam

Table 14-67 defines the library name and shared object name for the libpam library

**Table 14-67 libpam Definition** 

Library:	libpam
SONAME:	libpam.so.0

The Pluggable Authentication Module (PAM) interfaces allow applications to request authentication via a system administrator defined mechanism, known as a *service*.

A single service name, other, shall always be present. The behavior of this service shall be determined by the system administrator. Additional service names may also exist.

**Note:** Future versions of this specification might define additional service names.

The behavior of the interfaces in this library is specified by the following specifications: [LSB] <u>This Specification</u> [PAM] <u>PAM</u>

# 14.23.1 Pluggable Authentication API

### 14.23.1.1 Interfaces for Pluggable Authentication API

An LSB conforming implementation shall provide the generic functions for Pluggable Authentication API specified in <u>Table 14-68</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-68 libpam - Pluggable Authentication API Function Interfaces

pam_acct_mgmt( LIBPAM_1.0) [LSB]	pam_authenticate( LIBPAM_1.0) [LSB]	pam_chauthtok(LI BPAM_1.0) [LSB]	pam_close_sessio n(LIBPAM_1.0) [LSB]

# 14.24.2 security/pam\_appl.h

# 14.24.3 security/pam\_modules.h

# 14.25 Interface Definitions for libpam

The interfaces defined on the following pages are included in libpam and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 14.23</u> shall behave as described in the referenced base document.

### pam\_acct\_mgmt

#### **Name**

pam\_acct\_mgmt — establish the status of a user's account

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_acct_mgmt(pam_handle_t * pamh, int flags);
```

# **Description**

pam\_acct\_mgmt() establishes the account's usability and the user's accessibility to the system. It is typically called after the user has been authenticated.

flags may be specified as any valid flag (namely, one of those applicable to the flags argument of pam\_authenticate()). Additionally, the value of flags may be logically or'd with PAM\_SILENT.

### **Return Value**

PAM SUCCESS

Success.

#### PAM\_NEW\_AUTHTOK\_REQD

User is valid, but user's authentication token has expired. The correct response to this return-value is to require that the user satisfy the pam\_chauthtok() function before obtaining service. It may not be possible for an application to do this. In such a case, the user should be denied access until the account password is updated.

#### PAM\_ACCT\_EXPIRED

User is no longer permitted access to the system.

#### PAM\_AUTH\_ERR

Authentication error.

#### PAM\_PERM\_DENIED

User is not permitted to gain access at this time.

#### PAM\_USER\_UNKNOWN

User is not known to a module's account management component.

# pam\_authenticate

#### **Name**

pam\_authenticate — authenticate the user

## **Synopsis**

```
#include <security/pam_appl.h>
int pam_authenticate(pam_handle_t * pamh, int flags);
```

# **Description**

pam\_authenticate() serves as an interface to the authentication mechanisms of the loaded modules.

*flags* is an optional parameter that may be specified by the following value:

#### PAM\_DISALLOW\_NULL\_AUTHTOK

Instruct the authentication modules to return PAM\_AUTH\_ERR if the user does not have a registered authorization token.

Additionally, the value of *flags* may be logically or'd with PAM\_SILENT.

The process may need to be privileged in order to successfully call this function.

### **Return Value**

#### PAM\_SUCCESS

Success.

#### PAM\_AUTH\_ERR

User was not authenticated or process did not have sufficient privileges to perform authentication.

#### PAM CRED INSUFFICIENT

Application does not have sufficient credentials to authenticate the user.

#### PAM\_AUTHINFO\_UNAVAIL

Modules were not able to access the authentication information. This might be due to a network or hardware failure, etc.

#### PAM USER UNKNOWN

Supplied username is not known to the authentication service.

### PAM\_MAXTRIES

One or more authentication modules has reached its limit of tries authenticating the user. Do not try again.

### PAM\_ABORT

One or more authentication modules failed to load.

## pam\_chauthtok

#### Name

pam\_chauthtok — change the authentication token for a given user

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_chauthtok(pam_handle_t * pamh, const int flags);
```

# **Description**

pam\_chauthtok() is used to change the authentication token for a given user as indicated by the state associated with the handle *pamh*.

*flags* is an optional parameter that may be specified by the following value:

#### PAM\_CHANGE\_EXPIRED\_AUTHTOK

User's authentication token should only be changed if it has expired.

Additionally, the value of flags may be logically or'd with PAM\_SILENT.

### **RETURN VALUE**

#### PAM\_SUCCESS

Success.

#### PAM\_AUTHTOK\_ERR

A module was unable to obtain the new authentication token.

#### PAM\_AUTHTOK\_RECOVER\_ERR

A module was unable to obtain the old authentication token.

#### PAM\_AUTHTOK\_LOCK\_BUSY

One or more modules were unable to change the authentication token since it is currently locked.

#### PAM\_AUTHTOK\_DISABLE\_AGING

Authentication token aging has been disabled for at least one of the modules.

#### PAM\_PERM\_DENIED

Permission denied.

#### PAM\_TRY\_AGAIN

Not all modules were in a position to update the authentication token(s). In such a case, none of the user's authentication tokens are updated.

#### PAM USER UNKNOWN

User is not known to the authentication token changing service.

### pam\_close\_session

#### **Name**

pam\_close\_session — indicate that an authenticated session has ended

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_close_session(pam_handle_t * pamh, int flags);
```

## **Description**

pam\_close\_session() is used to indicate that an authenticated session has ended. It is used to inform the module that the user is exiting a session. It should be possible for the PAM library to open a session and close the same session from different applications.

flags may have the value PAM\_SILENT to indicate that no output should be generated as a result of this function call.

### **Return Value**

PAM SUCCESS

Success.

PAM\_SESSION\_ERR

One of the required loaded modules was unable to close a session for the user.

**Note:** Errors may be translated to text with pam\_strerror().

### pam\_end

#### Name

pam\_end — terminate the use of the PAM library

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_end(pam_handle_t * pamh, int pam_status);
```

# **Description**

pam\_end() terminates use of the PAM library. On success, the contents of \*pamh are no longer valid, and all memory associated with it is invalid.

Normally, *pam\_status* is passed the value PAM\_SUCCESS, but in the event of an unsuccessful service application, the appropriate PAM error return value should be used.

#### **Return Value**

PAM SUCCESS

Success.

## pam\_fail\_delay

### Name

pam\_fail\_delay — specify delay time to use on authentication error

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_fail_delay(pam_handle_t * pamh, unsigned int micro_sec);
```

# **Description**

pam\_fail\_delay() specifies the minimum delay for the PAM library to use when an authentication error occurs. The actual delay can vary by as much at 25%. If this function is called multiple times, the longest time specified by any of the call will be used.

The delay is invoked if an authentication error occurs during the pam\_authenticate() or pam\_chauthtok() function calls.

Independent of the success of pam\_authenticate() or pam\_chauthtok(), the delay time is reset to its default value of 0 when the PAM library returns control to the application from these two functions.

### **Return Value**

PAM\_SUCCESS

Success.

### pam\_get\_item

#### **Name**

pam\_get\_item — obtain the value of the indicated item.

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_get_item(const pam_handle_t * pamh, int item_type, const void
* * item);
```

## **Description**

pam\_get\_item() obtains the value of the indicated item\_type. The possible values
of item\_type are the same as listed for pam\_set\_item().

On success, *item* contains a pointer to the value of the corresponding item. Note that this is a pointer to the actual data and should not be free()'d or over-written.

### **Return Value**

PAM SUCCESS

Success.

PAM\_PERM\_DENIED

Application passed a NULL pointer for item.

PAM\_BAD\_ITEM

Application attempted to get an undefined item.

**Note:** Errors may be translated to text with pam\_strerror().

### pam\_getenv

#### Name

pam\_getenv — get a PAM environment variable

# **Synopsis**

```
#include <security/pam_appl.h>
const char * pam_getenv(const pam_handle_t * pamh, const char *
name);
```

# **Description**

The pam\_getenv() function shall search the environment associated with the PAM handle *pamh* for the environment variable *name*. If the specified environment variable cannot be found, a null pointer shall be returned. The application shall ensure that it does not modify the string pointed to by the pam\_getenv() function.

### **Return Value**

On success, pam\_getenv() returns a pointer to a string of the form name=value.

## pam\_getenvlist

#### **Name**

pam\_getenvlist — returns a pointer to the complete PAM environment.

# **Synopsis**

```
#include <security/pam_appl.h>
char * const * pam_getenvlist(pam_handle_t * pamh);
```

# **Description**

pam\_getenvlist() returns a pointer to the complete PAM environment. This pointer points to an array of pointers to NUL-terminated strings and must be terminated by a NULL pointer. Each string has the form "name=value".

The PAM library module allocates memory for the returned value and the associated strings. The calling application is responsible for freeing this memory.

### **Return Value**

pam\_getenvlist() returns an array of string pointers containing the PAM environment. On error, NULL is returned.

## pam\_open\_session

### **Name**

pam\_open\_session — indicate session has started

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_open_session(pam_handle_t * pamh, int flags);
```

# **Description**

The pam\_open\_session() function is used to indicate that an authenticated session has begun, after the user has been identified (see pam\_authenticate()) and, if necessary, granted credentials (see pam\_setcred()). It is used to inform the module that the user is currently in a session. It should be possible for the PAM library to open a session and close the same session from different applications.

flags may have the value PAM\_SILENT to indicate that no output be generated as a result of this function call.

### **Return Value**

PAM SUCCESS

Success.

PAM\_SESSION\_ERR

One of the loaded modules was unable to open a session for the user.

### pam\_putenv

#### **Name**

pam\_putenv — Add, replace or delete a PAM environment variable

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_putenv(const pam_handle_t * pamh, const char * name_value);
```

# **Description**

The pam\_putenv() function shall modify the environment list associated with pamh. If name\_value contains an '=' character, the characters to the left of the first '=' character represent the name, and the remaining characters after the '=' represent the value.

If the *name* environment variable exists in the environment associated with *pamh*, it shall be modified to have the value *value*. Otherwise, the *name* shall be added to the environment associated with *pamh* with the value *value*.

If there is no '=' character in *name\_value*, the variable in the environment associated with *pamh* named *name\_value* shall be deleted.

### **Return Value**

On success, the pam\_putenv() function shall return PAM\_SUCCESS. Otherwise the return value indicates the error:

#### PAM\_PERM\_DENIED

The name\_value argument is a null pointer.

### PAM\_BAD\_ITEM

The PAM environment variable named name\_value does not exist and therefore cannot be deleted.

#### PAM\_ABORT

The PAM handle identifed by pamh is corrupt.

### PAM\_BUF\_ERR

Memory buffer error.

### pam\_set\_item

#### **Name**

pam\_set\_item — (re)set the value of an item.

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_set_item(pam_handle_t * pamh, int item_type, const void *
item);
```

## **Description**

pam\_set\_item() (re)sets the value of one of the following item\_types:

#### PAM\_SERVICE

service name

#### PAM USER

user name

#### PAM TTY

terminal name

The value for a device file should include the /dev/ prefix. The value for graphical, X-based, applications should be the \$DISPLAY variable.

#### PAM\_RHOST

remote host name

#### PAM\_CONV

conversation structure

### PAM\_RUSER

remote user name

#### PAM USER PROMPT

string to be used when prompting for a user's name

The default value for this string is Please enter username: .

For all *item\_types* other than PAM\_CONV, *item* is a pointer to a NULL-terminated character string. In the case of PAM\_CONV, *item* points to an initialized pam\_conv structure.

#### **Return Value**

### PAM\_SUCCESS

Success.

### PAM\_PERM\_DENIED

An attempt was made to replace the conversation structure with a NULL value.

#### PAM\_BUF\_ERR

Function ran out of memory making a copy of the item.

#### LSB Core - Generic 5.0

#### PAM\_BAD\_ITEM

Application attempted to set an undefined item.

**Note:** Errors may be translated to text with pam\_strerror().

### pam\_setcred

### **Name**

pam\_setcred — set the module-specific credentials of the user

# **Synopsis**

```
#include <security/pam_appl.h>
extern int pam_setcred(pam_handle_t * pamh, int flags);
```

# **Description**

pam\_setcred() sets the module-specific credentials of the user. It is usually called after the user has been authenticated, after the account management function has been called and after a session has been opened for the user.

flags maybe specified from among the following values:

#### PAM\_ESTABLISH\_CRED

set credentials for the authentication service

#### PAM\_DELETE\_CRED

delete credentials associated with the authentication service

#### PAM\_REINITIALIZE\_CRED

reinitialize the user credentials

#### PAM REFRESH CRED

extend lifetime of the user credentials

Additionally, the value of flags may be logically or'd with PAM\_SILENT.

### **Return Value**

#### PAM\_SUCCESS

Success.

#### PAM\_CRED\_UNAVAIL

Module cannot retrieve the user's credentials.

#### PAM\_CRED\_EXPIRED

User's credentials have expired.

#### PAM\_USER\_UNKNOWN

User is not known to an authentication module.

#### PAM\_CRED\_ERR

Module was unable to set the credentials of the user.

## pam\_start

#### **Name**

pam\_start — initialize the PAM library

# **Synopsis**

```
#include <security/pam_appl.h>
int pam_start(const char * service_name, const char * user, const
struct pam_conv * pam_conversation, pam_handle_t * * pamh);
```

## **Description**

pam\_start() is used to initialize the PAM library. It must be called prior to any other usage of the PAM library. On success, \*pamh becomes a handle that provides continuity for successive calls to the PAM library. pam\_start() expects arguments as follows: the service\_name of the program, the username of the individual to be authenticated, a pointer to an application-supplied pam\_conv structure, and a pointer to a pam\_handle\_t pointer.

An application must provide the *conversation function* used for direct communication between a loaded module and the application. The application also typically provides a means for the module to prompt the user for a password, etc.

The structure, pam\_conv, is defined to be,

};

It is initialized by the application before it is passed to the library. The contents of this structure are attached to the \*pamh handle. The point of this argument is to provide a mechanism for any loaded module to interact directly with the application program; this is why it is called a conversation structure.

When a module calls the referenced conv() function, appdata\_ptr is set to the second element of this structure.

The other arguments of a call to conv() concern the information exchanged by module and application. *num\_msg* holds the length of the array of pointers passed via *msg*. On success, the pointer *resp* points to an array of *num\_msg* pam\_response structures, holding the application-supplied text. Note that *resp* is a struct pam\_response array and not an array of pointers.

### **Return Value**

PAM\_SUCCESS

Success.

PAM BUF ERR

Memory allocation error.

PAM\_ABORT

Internal failure.

### **ERRORS**

May be translated to text with pam\_strerror().

### pam\_strerror

#### Name

pam\_strerror — returns a string describing the PAM error

# **Synopsis**

```
#include <security/pam_appl.h>
const char * pam_strerror(pam_handle_t * pamh, int errnum);
```

# **Description**

pam\_strerror() returns a string describing the PAM error associated with errnum.

#### **Return Value**

On success, this function returns a description of the indicated error. The application should not free or modify this string. Otherwise, a string indicating that the error is unknown shall be returned. It is unspecified whether or not the string returned is translated according to the setting of LC\_MESSAGES.

# **IV Utility Libraries**

# 15 Utility Libraries

### 15.1 Introduction

An LSB-conforming implementation shall also support the following utility libraries which are built on top of the interfaces provided by the base libraries. These libraries implement common functionality, and hide additional system dependent information such as file formats and device names.

- libz
- · libncurses
- · libncursesw
- · libutil

The structure of the definitions for these libraries follows the same model as used for Base Libraries.

### 15.2 Interfaces for libz

Table 15-1 defines the library name and shared object name for the libz library

**Table 15-1 libz Definition** 

Library:	libz
SONAME:	libz.so.1

The behavior of the interfaces in this library is specified by the following specifications: [LSB] <u>This Specification</u>

# 15.2.1 Compression Library

### 15.2.1.1 Interfaces for Compression Library

An LSB conforming implementation shall provide the generic functions for Compression Library specified in <u>Table 15-2</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 15-2 libz - Compression Library Function Interfaces** 

adler32 [LSB]	compress [LSB]	compress2 [LSB]	compressBound(Z LIB_1.2.0) [LSB]
crc32 [LSB]	deflate [LSB]	deflateBound(ZLI B_1.2.0) [LSB]	deflateCopy [LSB]

### 15.3 Data Definitions for libz

This section defines global identifiers and their values that are associated with interfaces contained in libz. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

### 15.3.1 zconf.h

```
#define ZEXPORT
#define ZEXPORTVA
#define OF(args) args
#define ZEXTERN extern
```

#### 15.3.2 zlib.h

```
#define ZLIB_VERSION
                        "1.2.2"
#define Z_NULL 0
#define MAX WBITS
                        15

```

### 15.4 Interface Definitions for libz

The interfaces defined on the following pages are included in libz and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 15.2</u> shall behave as described in the referenced base document.

#### adler32

#### Name

adler32 — compute Adler 32 Checksum

# **Synopsis**

```
#include <zlib.h>
uLong adler32(uLong adler, const Bytef * buf, uInt len);
```

# **Description**

The adler32() function shall compute a running Adler-32 checksum (as described in RFC 1950: ZLIB Compressed Data Format Specication). On entry, adler is the previous value for the checksum, and buf shall point to an array of len bytes of data to be added to this checksum. The adler32() function shall return the new checksum.

If buf is NULL (or Z\_NULL), adler32() shall return the initial checksum.

#### Return Value

The adler32() function shall return the new checksum value.

#### **Errors**

None defined.

# Application Usage (informative)

The following code fragment demonstrates typical usage of the adler32() function:

```
uLong adler = adler32(0L, Z_NULL, 0);
while (read_buffer(buffer, length) != EOF) {
  adler = adler32(adler, buffer, length);
}
if (adler != original_adler) error();
```

### compress

### **Name**

compress — compress data

# **Synopsis**

```
#include <zlib.h>
int compress(Bytef * dest, uLongf * destLen, const Bytef * source,
uLong sourceLen);
```

# **Description**

The compress() function shall attempt to compress *sourceLen* bytes of data in the buffer *source*, placing the result in the buffer *dest*.

On entry, destLen should point to a value describing the size of the dest buffer. The application should ensure that this value be at least (sourceLen  $\times$  1.001) + 12. On successful exit, the variable referenced by destLen shall be updated to hold the length of compressed data in dest.

The compress() function is equivalent to compress2() with a *level* of Z\_DE-FAULT\_COMPRESSION.

### **Return Value**

On success, compress() shall return Z\_OK. Otherwise, compress() shall return a value to indicate the error.

#### **Errors**

On error, compress() shall return a value as described below:

```
Z_BUF_ERROR
```

The buffer *dest* was not large enough to hold the compressed data.

#### Z\_MEM\_ERROR

Insufficient memory.

### compress2

#### **Name**

compress 2 — compress data at a specified level

# **Synopsis**

```
#include <zlib.h>
int compress2(Bytef * dest, uLongf * destLen, const Bytef * source,
uLong sourceLen, int level);
```

## **Description**

The compress2() function shall attempt to compress *sourceLen* bytes of data in the buffer *source*, placing the result in the buffer *dest*, at the level described by *level*. The *level* supplied shall be a value between 0 and 9, or the value Z\_DEFAULT\_COMPRESSION. A *level* of 1 requests the highest speed, while a *level* of 9 requests the highest compression. A *level* of 0 indicates that no compression should be used, and the output shall be the same as the input.

On entry, destLen should point to a value describing the size of the dest buffer. The application should ensure that this value be at least (sourceLen  $\times$  1.001) + 12. On successful exit, the variable referenced by destLen shall be updated to hold the length of compressed data in dest.

The compress() function is equivalent to compress2() with a level of  $Z_DE-FAULT_COMPRESSION$ .

### **Return Value**

On success, compress2() shall return Z\_OK. Otherwise, compress2() shall return a value to indicate the error.

### **Errors**

On error, compress2() shall return a value as described below:

#### Z\_BUF\_ERROR

The buffer *dest* was not large enough to hold the compressed data.

### Z\_MEM\_ERROR

Insufficient memory.

#### Z\_STREAM\_ERROR

The *level* was not Z\_DEFAULT\_COMPRESSION, or was not between 0 and 9.

## compressBound

### Name

compressBound — compute compressed data size

# **Synopsis**

#include <zlib.h>
int compressBound(uLong sourceLen);

# **Description**

The compressBound() function shall estimate the size of buffer required to compress <code>sourceLen</code> bytes of data using the compress() or compress2() functions. If successful, the value returned shall be an upper bound for the size of buffer required to compress <code>sourceLen</code> bytes of data, using the parameters stored in <code>stream</code>, in a single call to <code>compress()</code> or <code>compress2()</code>.

### **Return Value**

The compressBound() shall return a value representing the upper bound of an array to allocate to hold the compressed data in a single call to compress() or compress2(). This function may return a conservative value that may be larger than *sourceLen*.

### **Errors**

None defined.

### crc32

### **Name**

crc32 — compute CRC-32 Checksum

# **Synopsis**

```
#include <zlib.h>
uLong crc32(uLong crc, const Bytef * buf, uInt len);
```

# **Description**

The crc32() function shall compute a running Cyclic Redundancy Check checksum, as defined in ITU-T V.42. On entry, crc is the previous value for the checksum, and buf shall point to an array of len bytes of data to be added to this checksum. The crc32() function shall return the new checksum.

If buf is NULL (or Z\_NULL), crc32() shall return the initial checksum.

### **Return Value**

The crc32() function shall return the new checksum value.

#### **Errors**

None defined.

# **Application Usage (informative)**

The following code fragment demonstrates typical usage of the crc32() function:

```
uLong crc = crc32(0L, Z_NULL, 0);
while (read_buffer(buffer, length) != EOF) {
  crc = crc32(crc, buffer, length);
}
if (crc != original_crc) error();
```

#### deflate

#### **Name**

deflate — compress data

# **Synopsis**

```
#include <zlib.h>
int deflate(z_streamp stream, int flush);
```

## **Description**

The deflate() function shall attempt to compress data until either the input buffer is empty or the output buffer is full. The *stream* references a z\_stream structure. Before the first call to deflate(), this structure should have been initialized by a call to deflateInit2\_().

**Note:** deflateInit2\_() is only in the binary standard; source level applications should initialize *stream* via a call to deflateInit() or deflateInit2().

In addition, the stream input and output buffers should have been initialized as follows:

next\_in

should point to the data to be compressed.

avail\_in

should contain the number of bytes of data in the buffer referenced by *next\_in*.

next\_out

should point to a buffer where compressed data may be placed.

avail\_out

should contain the size in bytes of the buffer referenced by next\_out

The deflate() function shall perform one or both of the following actions:

- 1. Compress input data from *next\_in* and update *next\_in*, *avail\_in* and *total\_in* to reflect the data that has been compressed.
- 2. Fill the output buffer referenced by next\_out, and update next\_out, avail\_out and total\_out to reflect the compressed data that has been placed there. If flush is not Z\_NO\_FLUSH, and avail\_out indicates that there is still space in output buffer, this action shall always occur (see below for further details).

The deflate() function shall return when either avail\_in reaches zero (indicating that all the input data has been compressed), or avail\_out reaches zero (indicating that the output buffer is full).

On success, the deflate() function shall set the *adler* field of the *stream* to the adler32() checksum of all the input data compressed so far (represented by *total\_in*).

If the deflate() function shall attempt to determine the type of input data, and set field data\_type in stream to Z\_ASCII if the majority of the data bytes fall within the ASCII (ISO 646) printable character range. Otherwise, it shall set data\_type to Z\_BINARY. This data type is informational only, and does not affect the compression algorithm.

#### LSB Core - Generic 5.0

**Note:** Future versions of the LSB may remove this requirement, since it is based on an outdated character set that does not support Internationalization, and does not affect the algorithm. It is included for information only at this release. Applications should not depend on this field.

### **Flush Operation**

The parameter *flush* determines when compressed bits are added to the output buffer in *next\_out*. If *flush* is Z\_NO\_FLUSH, deflate() may return with some data pending output, and not yet added to the output buffer.

If *flush* is Z\_SYNC\_FLUSH, deflate() shall flush all pending output to *next\_out* and align the output to a byte boundary. A synchronization point is generated in the output.

If *flush* is Z\_FULL\_FLUSH, all output shall be flushed, as for Z\_SYNC\_FLUSH, and the compression state shall be reset. A synchronization point is generated in the output.

**Rationale:** Z\_SYNC\_FLUSH is intended to ensure that the compressed data contains all the data compressed so far, and allows a decompressor to reconstruct all of the input data. Z\_FULL\_FLUSH allows decompression to restart from this point if the previous compressed data has been lost or damaged. Flushing is likely to degrade the performance of the compression system, and should only be used where necessary.

If <code>flush</code> is set to <code>Z\_FINISH</code>, all pending input shall be processed and <code>deflate()</code> shall return with <code>Z\_STREAM\_END</code> if there is sufficient space in the output buffer at <code>next\_out</code>, as indicated by <code>avail\_out</code>. If <code>deflate()</code> is called with <code>flush</code> set to <code>Z\_FINISH</code> and there is insufficient space to store the compressed data, and no other error has occurred during compression, <code>deflate()</code> shall return <code>Z\_OK</code>, and the application should call <code>deflate()</code> again with <code>flush</code> unchanged, and having updated <code>next\_out</code> and <code>avail\_out</code>.

If all the compression is to be done in a single step, deflate() may be called with flush set to Z\_FINISH immediately after the stream has been initialized if avail\_out is set to at least the value returned by deflateBound().

### **Return Value**

On success, deflate() shall return Z\_OK, unless *flush* was set to Z\_FINISH and there was sufficient space in the output buffer to compress all of the input data. In this case, deflate() shall return Z\_STREAM\_END. On error, deflate() shall return a value to indicate the error.

**Note:** If deflate() returns Z\_OK and has set avail\_out to zero, the function should be called again with the same value for flush, and with updated next\_out and avail\_out until deflate() returns with Z\_OK (or Z\_STREAM\_END if flush is set to Z\_FINISH) and a non-zero avail\_out.

#### **Errors**

On error, deflate() shall return a value as described below, and set the *msg* field of *stream* to point to a string describing the error:

#### Z\_BUF\_ERROR

No progress is possible; either avail\_in or avail\_out was zero.

#### Z\_MEM\_ERROR

Insufficient memory.

#### Z\_STREAM\_ERROR

The state (as represented in stream) is inconsistent, or stream was NULL.

### deflateBound

### **Name**

deflateBound — compute compressed data size

# **Synopsis**

```
#include <zlib.h>
int deflateBound(z_streamp stream, uLong sourceLen);
```

## **Description**

The deflateBound() function shall estimate the size of buffer required to compress <code>sourceLen</code> bytes of data. If successful, the value returned shall be an upper bound for the size of buffer required to compress <code>sourceLen</code> bytes of data, using the parameters stored in <code>stream</code>, in a single call to deflate() with flush set to <code>Z\_FINISH</code>.

On entry, *stream* should have been initialized via a call to deflateInit\_() or deflateInit2\_().

### **Return Value**

The deflateBound() shall return a value representing the upper bound of an array to allocate to hold the compressed data in a single call to deflate(). If the *stream* is not correctly initialized, or is NULL, then deflateBound() may return a conservative value that may be larger than *sourceLen*.

#### **Errors**

None defined.

## deflateCopy

#### **Name**

deflateCopy — copy compression stream

# **Synopsis**

```
#include <zlib.h>
int deflateCopy(z_streamp dest, z_streamp source);
```

# **Description**

The deflateCopy() function shall copy the compression state information in *source* to the uninitialized z\_stream structure referenced by *dest*.

On successful return, *dest* will be an exact copy of the stream referenced by *source*. The input and output buffer pointers in *next\_in* and *next\_out* will reference the same data.

### **Return Value**

On success, deflateCopy() shall return Z\_OK. Otherwise it shall return a value less than zero to indicate the error.

### **Errors**

On error, deflateCopy() shall return a value as described below:

Z\_STREAM\_ERROR

The state in source is inconsistent, or either source or dest was NULL.

Z\_MEM\_ERROR

Insufficient memory available.

# **Application Usage (informative)**

This function can be useful when several compression strategies will be tried, for example when there are several ways of pre-processing the input data with a filter. The streams that will be discarded should then be freed by calling deflateEnd(). Note that deflateCopy() duplicates the internal compression state which can be quite large, so this strategy may be slow and can consume lots of memory.

### deflateEnd

### Name

deflateEnd — free compression stream state

# **Synopsis**

```
#include <zlib.h>
int deflateEnd(z_streamp stream);
```

# **Description**

The deflateEnd() function shall free all allocated state information referenced by *stream*. All pending output is discarded, and unprocessed input is ignored.

### **Return Value**

On success, deflateEnd() shall return Z\_OK, or Z\_DATA\_ERROR if there was pending output discarded or input unprocessed. Otherwise it shall return Z\_STREAM\_ERROR to indicate the error.

### **Errors**

On error, deflateEnd() shall return Z\_STREAM\_ERROR. The following conditions shall be treated as an error:

- The state in *stream* is inconsistent or inappropriate.
- stream is NULL.

### deflateInit2

#### **Name**

deflateInit2\_ — initialize compression system

# **Synopsis**

```
#include <zlib.h>
  int deflateInit2_ (z_streamp strm, int level, int method, int
windowBits, int memLevel, int strategy, char * version, int
stream_size);
```

## **Description**

The deflateInit2\_() function shall initialize the compression system. On entry, *strm* shall refer to a user supplied z\_stream object (a z\_stream\_s structure). The following fields shall be set on entry:

#### zalloc

a pointer to an alloc\_func function, used to allocate state information. If this is NULL, a default allocation function will be used.

#### zfree

a pointer to a free\_func function, used to free memory allocated by the *zalloc* function. If this is NULL a default free function will be used.

#### opaque

If alloc\_func is not NULL, opaque is a user supplied pointer to data that will be passed to the alloc\_func and free\_func functions.

If the *version* requested is not compatible with the version implemented, or if the size of the z\_stream\_s structure provided in *stream\_size* does not match the size in the library implementation, deflateInit2\_() shall fail, and return Z\_VERSION\_ERROR.

The *level* supplied shall be a value between 0 and 9, or the value Z\_DEFAULT\_COM-PRESSION. A *level* of 1 requests the highest speed, while a *level* of 9 requests the highest compression. A *level* of 0 indicates that no compression should be used, and the output shall be the same as the input.

The *method* selects the compression algorithm to use. LSB conforming implementation shall support the Z\_DEFLATED method, and may support other implementation defined methods.

The windowBits parameter shall be a base 2 logarithm of the window size to use, and shall be a value between 8 and 15. A smaller value will use less memory, but will result in a poorer compression ratio, while a higher value will give better compression but utilize more memory.

The memLevel parameter specifies how much memory to use for the internal state. The value of memLevel shall be between 1 and MAX\_MEM\_LEVEL. Smaller values use less memory but are slower, while higher values use more memory to gain compression speed.

The *strategy* parameter selects the compression strategy to use:

#### Z\_DEFAULT\_STRATEGY

use the system default compression strategy. Z\_DEFAULT\_STRATEGY is particularly appropriate for text data.

### Z\_FILTERED

use a compression strategy tuned for data consisting largely of small values with a fairly random distribution. Z\_FILTERED uses more Huffman encoding and less string matching than Z\_DEFAULT\_STRATEGY.

#### Z\_HUFFMAN\_ONLY

force Huffman encoding only, with no string match.

The deflateInit2\_() function is not in the source standard; it is only in the binary standard. Source applications should use the deflateInit2() macro.

### **Return Value**

On success, the deflateInit2\_() function shall return Z\_OK. Otherwise, deflateInit2\_() shall return a value as described below to indicate the error.

### **Errors**

On error, deflateInit2\_() shall return one of the following error indicators:

#### Z\_STREAM\_ERROR

Invalid parameter.

#### Z\_MEM\_ERROR

Insufficient memory available.

#### Z\_VERSION\_ERROR

The version requested is not compatible with the library version, or the z\_stream size differs from that used by the library.

In addition, the *msg* field of the *strm* may be set to an error message.

### deflateInit\_

#### **Name**

deflateInit\_ — initialize compression system

# **Synopsis**

```
#include <zlib.h>
int deflateInit_(z_streamp stream, int level, const char * version,
int stream_size);
```

## **Description**

The deflateInit\_() function shall initialize the compression system. On entry, *stream* shall refer to a user supplied z\_stream object (a z\_stream\_s structure). The following fields shall be set on entry:

#### zalloc

a pointer to an alloc\_func function, used to allocate state information. If this is NULL, a default allocation function will be used.

#### zfree

a pointer to a free\_func function, used to free memory allocated by the *zalloc* function. If this is NULL a default free function will be used.

#### opaque

If alloc\_func is not NULL, opaque is a user supplied pointer to data that will be passed to the alloc\_func and free\_func functions.

If the *version* requested is not compatible with the version implemented, or if the size of the z\_stream\_s structure provided in *stream\_size* does not match the size in the library implementation, deflateInit\_() shall fail, and return Z\_VERSION\_ERROR.

The *level* supplied shall be a value between 0 and 9, or the value Z\_DEFAULT\_COM-PRESSION. A *level* of 1 requests the highest speed, while a *level* of 9 requests the highest compression. A *level* of 0 indicates that no compression should be used, and the output shall be the same as the input.

The deflateInit\_() function is not in the source standard; it is only in the binary standard. Source applications should use the deflateInit() macro.

The  $deflateInit_()$  function is equivalent to

```
deflateInit2_(stream, level, Z_DEFLATED, MAX_WBITS,
MAX_MEM_LEVEL,
```

Z\_DEFAULT\_STRATEGY, version,

stream\_size);

### **Return Value**

On success, the deflateInit\_() function shall return Z\_OK. Otherwise, deflateInit\_() shall return a value as described below to indicate the error.

### **Errors**

On error, deflateInit\_() shall return one of the following error indicators:

### Z\_STREAM\_ERROR

Invalid parameter.

### Z\_MEM\_ERROR

Insufficient memory available.

#### Z\_VERSION\_ERROR

The version requested is not compatible with the library version, or the z\_stream size differs from that used by the library.

In addition, the *msg* field of the *stream* may be set to an error message.

#### deflateParams

#### **Name**

deflateParams — set compression parameters

# **Synopsis**

```
#include <zlib.h>
int deflateParams(z_streamp stream, int level, int strategy);
```

## **Description**

The deflateParams() function shall dynamically alter the compression parameters for the compression stream object *stream*. On entry, *stream* shall refer to a user supplied z\_stream object (a z\_stream\_s structure), already initialized via a call to deflateInit\_() or deflateInit2\_().

The <code>level</code> supplied shall be a value between 0 and 9, or the value <code>Z\_DEFAULT\_COMPRESSION</code>. A <code>level</code> of 1 requests the highest speed, while a <code>level</code> of 9 requests the highest compression. A <code>level</code> of 0 indicates that no compression should be used, and the output shall be the same as the input. If the compression level is altered by <code>deflateParams()</code>, and some data has already been compressed with this <code>stream</code> (i.e. <code>total\_in</code> is not zero), and the new <code>level</code> requires a different underlying compression method, then <code>stream</code> shall be flushed by a call to <code>deflate()</code>.

The *strategy* parameter selects the compression strategy to use:

#### **Z\_DEFAULT\_STRATEGY**

use the system default compression strategy. Z\_DEFAULT\_STRATEGY is particularly appropriate for text data.

#### Z\_FILTERED

use a compression strategy tuned for data consisting largely of small values with a fairly random distribution. Z\_FILTERED uses more Huffman encoding and less string matching than Z\_DEFAULT\_STRATEGY.

#### $Z\_HUFFMAN\_ONLY$

force Huffman encoding only, with no string match.

### **Return Value**

On success, the deflateParams() function shall return Z\_OK. Otherwise, deflate-Params() shall return a value as described below to indicate the error.

#### **Errors**

On error, deflateParams() shall return one of the following error indicators:

#### Z\_STREAM\_ERROR

Invalid parameter.

#### Z\_MEM\_ERROR

Insufficient memory available.

#### Z\_BUF\_ERROR

Insufficient space in stream to flush the current output.

In addition, the msg field of the strm may be set to an error message.

# **Application Usage (Informative)**

Applications should ensure that the stream is flushed, e.g. by a call to  $deflate(stream, Z\_SYNC\_FLUSH)$  before calling deflateParams(), or ensure that there is sufficient space in  $next\_out$  (as identified by  $avail\_out$ ) to ensure that all pending output and all uncompressed input can be flushed in a single call to deflate().

**Rationale:** Although the deflateParams() function should flush pending output and compress all pending input, the result is unspecified if there is insufficient space in the output buffer. Applications should only call deflateParams() when the *stream* is effectively empty (flushed).

The deflateParams() can be used to switch between compression and straight copy of the input data, or to switch to a different kind of input data requiring a different strategy.

#### deflateReset

### **Name**

deflateReset — reset compression stream state

## **Synopsis**

```
#include <zlib.h>
int deflateReset(z_streamp stream);
```

# **Description**

The deflateReset() function shall reset all state associated with *stream*. All pending output shall be discarded, and the counts of processed bytes (*total\_in* and *total\_out*) shall be reset to zero.

### **Return Value**

On success, deflateReset() shall return Z\_OK. Otherwise it shall return Z\_STREAM\_ERROR to indicate the error.

#### **Errors**

On error, deflateReset() shall return Z\_STREAM\_ERROR. The following conditions shall be treated as an error:

- The state in *stream* is inconsistent or inappropriate.
- stream is NULL.

486

## deflateSetDictionary

#### Name

deflateSetDictionary — initialize compression dictionary

# **Synopsis**

#include <zlib.h>
int deflateSetDictionary(z\_streamp stream, const Bytef \* dictionary,
uInt dictlen);

## **Description**

The deflateSetDictionary() function shall initialize the compression dictionary associated with *stream* using the *dictlen* bytes referenced by *dictionary*.

The implementation may silently use a subset of the provided dictionary if the dictionary cannot fit in the current window associated with <code>stream</code> (see deflateInit2\_()). The application should ensure that the dictionary is sorted such that the most commonly used strings occur at the end of the dictionary.

If the dictionary is successfully set, the Adler32 checksum of the entire provided dictionary shall be stored in the *adler* member of *stream*. This value may be used by the decompression system to select the correct dictionary. The compression and decompression systems must use the same dictionary.

stream shall reference an initialized compression stream, with total\_in zero (i.e. no data has been compressed since the stream was initialized).

#### **Return Value**

On success, deflateSetDictionary() shall return  $Z_OK$ . Otherwise it shall return  $Z_STREAM\_ERROR$  to indicate an error.

#### **Errors**

On error, deflateSetDictionary() shall return a value as described below:

Z\_STREAM\_ERROR

The state in stream is inconsistent, or stream was NULL.

# **Application Usage (informative)**

The application should provide a dictionary consisting of strings {{{ed note: do we really mean "strings"? Null terminated?}}} that are likely to be encountered in the data to be compressed. The application should ensure that the dictionary is sorted such that the most commonly used strings occur at the end of the dictionary.

The use of a dictionary is optional; however if the data to be compressed is relatively short and has a predictable structure, the use of a dictionary can substantially improve the compression ratio.

## get\_crc\_table

### Name

get\_crc\_table — generate a table for crc calculations

# **Synopsis**

```
#include <zlib.h>
const uLongf * get_crc_table(void);
```

# **Description**

Generate tables for a byte-wise 32-bit CRC calculation based on the polynomial:  $x^{32}+x^{26}+x^{23}+x^{22}+x^{16}+x^{12}+x^{11}+x^{10}+x^8+x^7+x^5+x^4+x^2+x+1$ 

In a multi-threaded application, get\_crc\_table() should be called by one thread to initialize the tables before any other thread calls any libz function.

### **Return Value**

The get\_crc\_table() function shall return a pointer to the first of a set of tables used internally to calculate CRC-32 values (see crc32()).

### **Errors**

None defined.

## gzclose

### Name

gzclose — close a compressed file stream

# **Synopsis**

```
#include <zlib.h>
int gzclose (gzFile file );
```

# **Description**

The gzclose() function shall close the compressed file stream *file*. If *file* was open for writing, gzclose() shall first flush any pending output. Any state information allocated shall be freed.

### **Return Value**

On success, gzclose() shall return Z\_OK. Otherwise, gzclose() shall return an error value as described below.

### **Errors**

On error, gzclose() may set the global variable errno to indicate the error. The gzclose() shall return a value other than Z\_OK on error.

#### Z\_STREAM\_ERROR

file was NULL (or Z\_NULL), or did not refer to an open compressed file stream.

#### Z\_ERRNO

An error occurred in the underlying base libraries, and the application should check errno for further information.

#### Z\_BUF\_ERROR

no compression progress is possible during buffer flush (see deflate()).

## gzdopen

### **Name**

gzdopen — open a compressed file

# **Synopsis**

```
#include <zlib.h>
  gzFile gzdopen ( int fd, const char *mode );
```

# **Description**

The gzdopen() function shall attempt to associate the open file referenced by *fd* with a gzFile object. The *mode* argument is based on that of fopen(), but the *mode* parameter may also contain the following characters:

digit

set the compression level to *digit*. A low value (e.g. 1) means high speed, while a high value (e.g. 9) means high compression. A compression level of 0 (zero) means no compression. See deflateInit2\_() for further details.

[fhR]

set the compression strategy to [fhR]. The letter f corresponds to filtered data, the letter h corresponds to Huffman only compression, and the letter R corresponds to Run Length Encoding. See deflateInit2\_() for further details.

If fd refers to an uncompressed file, and mode refers to a read mode, gzdopen() shall attempt to open the file and return a gzFile object suitable for reading directly from the file without any decompression.

If mode is NULL, or if mode does not contain one of r, w, or a, gzdopen() shall return  $Z_NULL$ , and need not set any other error condition.

# **Example**

```
gzdopen(fileno(stdin), "r");
```

Attempt to associate the standard input with a gzFile object.

#### Return Value

On success, gzdopen() shall return a gzFile object. On failure, gzdopen() shall return Z\_NULL and may set errno accordingly.

**Note:** At version 1.2.2, zlib does not set errno for several error conditions. Applications may not be able to determine the cause of an error.

### **Errors**

On error, gzdopen() may set the global variable errno to indicate the error.

### gzeof

### **Name**

gzeof — check for end-of-file on a compressed file stream

# **Synopsis**

```
#include <zlib.h>
int gzeof (gzFile file );
```

# **Description**

The gzeof() function shall test the compressed file stream file for end of file.

### **Return Value**

If *file* was open for reading and end of file has been reached, gzeof() shall return 1. Otherwise, gzeof() shall return 0.

### **Errors**

None defined.

### gzerror

#### **Name**

gzerror — decode an error on a compressed file stream

# **Synopsis**

```
#include <zlib.h>
  const char * gzerror (gzFile file, int * errnum);
```

# **Description**

The <code>gzerror()</code> function shall return a string describing the last error to have occurred associated with the open compressed file stream referred to by <code>file</code>. It shall also set the location referenced by <code>errnum</code> to an integer value that further identifies the error.

### **Return Value**

The gzerror() function shall return a string that describes the last error associated with the given *file* compressed file stream. This string shall have the format "%s: %s", with the name of the file, followed by a colon, a space, and the description of the error. If the compressed file stream was opened by a call to gzdopen(), the format of the filename is unspecified.

**Rationale:** Although in all current implementations of libz file descriptors are named "<fd:%d>", the code suggests that this is for debugging purposes only, and may change in a future release.

It is unspecified if the string returned is determined by the setting of the LC\_MESSAGES category in the current locale.

#### **Errors**

None defined.

### gzflush

#### **Name**

gzflush — flush a compressed file stream

# **Synopsis**

```
#include <zlib.h>
int gzflush(gzFile file, int flush);
```

# **Description**

The gzflush() function shall flush pending output to the compressed file stream identified by *file*, which must be open for writing.

### **Flush Operation**

The parameter *flush* determines which compressed bits are added to the output file. If *flush* is Z\_NO\_FLUSH, gzflush() may return with some data pending output, and not yet written to the file.

If *flush* is Z\_SYNC\_FLUSH, gzflush() shall flush all pending output to *file* and align the output to a byte boundary. There may still be data pending compression that is not flushed.

If *flush* is Z\_FULL\_FLUSH, all output shall be flushed, as for Z\_SYNC\_FLUSH, and the compression state shall be reset. There may still be data pending compression that is not flushed.

**Rationale:** Z\_SYNC\_FLUSH is intended to ensure that the compressed data contains all the data compressed so far, and allows a decompressor to reconstruct all of the input data. Z\_FULL\_FLUSH allows decompression to restart from this point if the previous compressed data has been lost or damaged. Flushing is likely to degrade the performance of the compression system, and should only be used where necessary.

If *flush* is set to Z\_FINISH, all pending uncompressed data shall be compressed and all output shall be flushed.

### **Return Value**

On success, gzflush() shall return the value Z\_OK. Otherwise gzflush() shall return a value to indicate the error, and may set the error number associated with the compressed file stream *file*.

**Note:** If flush is set to Z\_FINISH and the flush operation is successful, gzflush() will return Z\_OK, but the compressed file stream error value may be set to Z\_STREAM\_END.

#### **Errors**

On error, gzflush() shall return an error value, and may set the error number associated with the stream identified by *file* to indicate the error. Applications may use gzerror() to access this error value.

#### Z\_ERRNO

An underlying base library function has indicated an error. The global variable erron may be examined for further information.

#### Z\_STREAM\_ERROR

The stream is invalid, is not open for writing, or is in an invalid state.

#### LSB Core - Generic 5.0

```
Z_BUF_ERROR
```

no compression progress is possible (see deflate()).

Z\_MEM\_ERROR

Insufficient memory available to compress.

### gzgetc

### Name

gzgetc — read a character from a compressed file

# **Synopsis**

```
#include <zlib.h>
int gzgetc (gzFile file);
```

## **Description**

The gzgetc() function shall read the next single character from the compressed file stream referenced by *file*, which shall have been opened in a read mode (see gzopen() and gzdopen()).

### **Return Value**

On success, gzgetc() shall return the uncompressed character read, otherwise, on end of file or error, gzgetc() shall return -1.

#### **Errors**

On end of file or error, gzgetc() shall return -1. Further information can be found by calling gzerror() with a pointer to the compressed file stream.

### gzgets

### **Name**

gzgets — read a string from a compressed file

# **Synopsis**

```
#include <zlib.h>
  char * gzgets (gzFile file, char * buf, int len);
```

## **Description**

The gzgets() function shall attempt to read data from the compressed file stream *file*, uncompressing it into *buf* until either *len-1* bytes have been inserted into *buf*, or until a newline character has been uncompressed into *buf*. A null byte shall be appended to the uncompressed data. The *file* shall have been opened in for reading (see gzopen() and gzdopen()).

### **Return Value**

On success, gzgets() shall return a pointer to *buf*. Otherwise, gzgets() shall return Z\_NULL. Applications may examine the cause using gzerror().

#### **Errors**

On error, gzgets() shall return  $Z_NULL$ . The following conditions shall always be treated as an error:

file is NULL, or does not refer to a file open for reading;

buf is NULL;

1en is less than or equal to zero.

### gzopen

#### **Name**

gzopen — open a compressed file

# **Synopsis**

```
#include <zlib.h>
  gzFile gzopen (const char *path , const char *mode );
```

# **Description**

The gzopen() function shall open the compressed file named by *path*. The *mode* argument is based on that of fopen(), but the *mode* parameter may also contain the following characters:

digit

set the compression level to *digit*. A low value (e.g. 1) means high speed, while a high value (e.g. 9) means high compression. A compression level of 0 (zero) means no compression. See deflateInit2\_() for further details.

[fhR]

set the compression strategy to [fhR]. The letter f corresponds to filtered data, the letter h corresponds to Huffman only compression, and the letter R corresponds to Run Length Encoding. See deflateInit2\_() for further details.

If *path* refers to an uncompressed file, and *mode* refers to a read mode, gzopen() shall attempt to open the file and return a gzFile object suitable for reading directly from the file without any decompression.

If *path* or *mode* is NULL, or if *mode* does not contain one of r, w, or a, gzopen() shall return Z\_NULL, and need not set any other error condition.

The gzFile object is also referred to as a compressed file stream.

# **Example**

```
gzopen("file.gz", "w6h");
```

Attempt to create a new compressed file, file.gz, at compression level 6 using Huffman only compression.

### **Return Value**

On success, gzopen() shall return a gzFile object (also known as a *compressed file stream*). On failure, gzopen() shall return Z\_NULL and may set errno accordingly.

**Note:** At version 1.2.2, zlib does not set errno for several error conditions. Applications may not be able to determine the cause of an error.

#### **Errors**

On error, gzopen() may set the global variable errno to indicate the error.

## gzprintf

### **Name**

gzprintf — format data and compress

# **Synopsis**

```
#include <zlib.h>
int gzprintf (gzFile file, const char * fmt, ...);
```

# **Description**

The <code>gzprintf()</code> function shall format data as for <code>fprintf()</code>, and write the resulting string to the compressed file stream <code>file</code>.

### **Return Value**

The <code>gzprintf()</code> function shall return the number of uncompressed bytes actually written, or a value less than or equal to 0 in the event of an error.

### **Errors**

If *file* is NULL, or refers to a compressed file stream that has not been opened for writing, gzprintf() shall return Z\_STREAM\_ERROR. Otherwise, errors are as for gzwrite().

## gzputc

### **Name**

gzputc — write character to a compressed file

# **Synopsis**

```
#include <zlib.h>
int gzputc (gzFile file, int c);
```

# **Description**

The gzputc() function shall write the single character c, converted from integer to unsigned character, to the compressed file referenced by *file*, which shall have been opened in a write mode (see gzopen() and gzdopen()).

#### Return Value

On success, gzputc() shall return the value written, otherwise gzputc() shall return -1.

### **Errors**

On error, gzputc() shall return -1.

### gzputs

### **Name**

gzputs — string write to a compressed file

# **Synopsis**

```
#include <zlib.h>
  int gzputs (gzFile file, const char * s);
```

## **Description**

The gzputs() function shall write the null terminated string s to the compressed file referenced by *file*, which shall have been opened in a write mode (see gzopen() and gzdopen()). The terminating null character shall not be written. The gzputs() function shall return the number of uncompressed bytes actually written.

### **Return Value**

On success, gzputs() shall return the number of uncompressed bytes actually written to file. On error gzputs() shall return a value less than or equal to 0. Applications may examine the cause using gzerror().

#### **Errors**

On error, gzputs() shall set the error number associated with the stream identified by *file* to indicate the error. Applications should use gzerror() to access this error value. If *file* is NULL, gzputs() shall return Z\_STREAM\_ERR.

#### Z\_ERRNO

An underlying base library function has indicated an error. The global variable errno may be examined for further information.

#### Z\_STREAM\_ERROR

The stream is invalid, is not open for writing, or is in an invalid state.

#### Z\_BUF\_ERROR

no compression progress is possible (see deflate()).

#### Z\_MEM\_ERROR

Insufficient memory available to compress.

### gzread

#### **Name**

gzread — read from a compressed file

# **Synopsis**

```
#include <zlib.h>
  int gzread (gzFile file, voidp buf, unsigned int len);
```

# **Description**

The gzread() function shall read data from the compressed file referenced by file, which shall have been opened in a read mode (see gzopen() and gzdopen()). The gzread() function shall read data from file, and uncompress it into buf. At most, len bytes of uncompressed data shall be copied to buf. If the file is not compressed, gzread() shall simply copy data from file to buf without alteration.

### **Return Value**

On success, gzread() shall return the number of bytes decompressed into buf. If gzread() returns 0, either the end-of-file has been reached or an underlying read error has occurred. Applications should use gzerror() or gzeof() to determine which occurred. On other errors, gzread() shall return a value less than 0 and applications may examine the cause using gzerror().

#### **Errors**

On error, gzread() shall set the error number associated with the stream identified by *file* to indicate the error. Applications should use gzerror() to access this error value.

#### Z\_ERRNO

An underlying base library function has indicated an error. The global variable erron may be examined for further information.

#### Z\_STREAM\_END

End of file has been reached on input.

#### Z\_DATA\_ERROR

A CRC error occurred when reading data; the file is corrupt.

#### Z\_STREAM\_ERROR

The stream is invalid, or is in an invalid state.

#### Z\_NEED\_DICT

A dictionary is needed (see inflateSetDictionary()).

#### Z\_MEM\_ERROR

Insufficient memory available to decompress.

## gzrewind

### Name

gzrewind — reset the file-position indicator on a compressed file stream

# **Synopsis**

```
#include <zlib.h>
int gzrewind(gzFile file);
```

# **Description**

The gzrewind() function shall set the starting position for the next read on compressed file stream *file* to the beginning of file. *file* must be open for reading.

```
gzrewind() is equivalent to
(int)gzseek(file, OL, SEEK_SET)
```

.

### **Return Value**

On success, gzrewind() shall return 0. On error, gzrewind() shall return -1, and may set the error value for *file* accordingly.

### **Errors**

On error, gzrewind() shall return -1, indicating that *file* is NULL, or does not represent an open compressed file stream, or represents a compressed file stream that is open for writing and is not currently at the beginning of file.

### gzseek

#### **Name**

gzseek — reposition a file-position indicator in a compressed file stream

# **Synopsis**

```
#include <zlib.h>
z_off_t gzseek(gzFile file, z_off_t offset, int whence);
```

# **Description**

The gzseek() function shall set the file-position indicator for the compressed file stream *file*. The file-position indicator controls where the next read or write operation on the compressed file stream shall take place. The *offset* indicates a byte offset in the uncompressed data. The *whence* parameter may be one of:

SEEK\_SET

the offset is relative to the start of the uncompressed data.

SEEK\_CUR

the offset is relative to the current positition in the uncompressed data.

**Note:** The value SEEK\_END need not be supported.

If the *file* is open for writing, the new offset must be greater than or equal to the current offset. In this case, gzseek() shall compress a sequence of null bytes to fill the gap from the previous offset to the new offset.

### **Return Value**

On success, gzseek() shall return the resulting offset in the file expressed as a byte position in the *uncompressed* data stream. On error, gzseek() shall return -1, and may set the error value for *file* accordingly.

#### **Errors**

On error, gzseek() shall return -1. The following conditions shall always result in an error:

- file is NULL
- file does not represent an open compressed file stream.
- file refers to a compressed file stream that is open for writing, and the newly computed offset is less than the current offset.
- The newly computed offset is less than zero.
- whence is not one of the supported values.

# **Application Usage (informative)**

If *file* is open for reading, the implementation may still need to uncompress all of the data up to the new offset. As a result, gzseek() may be extremely slow in some circumstances.

### gzsetparams

### **Name**

gzsetparams — dynamically set compression parameters

# **Synopsis**

```
#include <zlib.h>
int gzsetparams (gzFile file, int level, int strategy);
```

# **Description**

The gzsetparams() function shall set the compression level and compression strategy on the compressed file stream referenced by *file*. The compressed file stream shall have been opened in a write mode. The *level* and *strategy* are as defined in <u>deflateInit2</u>. If there is any data pending writing, it shall be flushed before the parameters are updated.

#### **Return Value**

On success, the gzsetparams() function shall return Z\_OK.

#### **Errors**

On error, gzsetparams() shall return one of the following error indications:

Z\_STREAM\_ERROR

Invalid parameter, or file not open for writing.

Z\_BUF\_ERROR

An internal inconsistency was detected while flushing the previous buffer.

### gztell

### Name

gztell — find position on a compressed file stream

# **Synopsis**

```
#include <zlib.h>
  z_off_t gztell (gzFile file );
```

# **Description**

The gztell() function shall return the starting position for the next read or write operation on compressed file stream *file*. This position represents the number of bytes from the beginning of file in the uncompressed data.

```
gztell() is equivalent to
gzseek(file, OL, SEEK_CUR)
```

### **Return Value**

gztell() shall return the current offset in the file expressed as a byte position in the *uncompressed* data stream. On error, gztell() shall return -1, and may set the error value for *file* accordingly.

### **Errors**

On error, gztell() shall return -1, indicating that file is NULL, or does not represent an open compressed file stream.

## gzwrite

### **Name**

gzwrite — write to a compressed file

# **Synopsis**

```
#include <zlib.h>
  int gzwrite (gzFile file, voidpc buf, unsigned int len);
```

# **Description**

The gzwrite() function shall write data to the compressed file referenced by *file*, which shall have been opened in a write mode (see gzopen() and gzdopen()). On entry, *buf* shall point to a buffer containing *len* bytes of uncompressed data. The gzwrite() function shall compress this data and write it to *file*. The gzwrite() function shall return the number of uncompressed bytes actually written.

### **Return Value**

On success, gzwrite() shall return the number of uncompressed bytes actually written to file. On error gzwrite() shall return a value less than or equal to 0. Applications may examine the cause using gzerror().

### **Errors**

On error, gzwrite() shall set the error number associated with the stream identified by *file* to indicate the error. Applications should use gzerror() to access this error value.

#### Z\_ERRNO

An underlying base library function has indicated an error. The global variable erron may be examined for further information.

### Z\_STREAM\_ERROR

The stream is invalid, is not open for writing, or is in an invalid state.

#### Z\_BUF\_ERROR

no compression progress is possible (see deflate()).

#### Z\_MEM\_ERROR

Insufficient memory available to compress.

#### inflate

#### **Name**

inflate — decompress data

# **Synopsis**

```
#include <zlib.h>
int inflate(z_streamp stream, int flush);
```

## **Description**

The inflate() function shall attempt to decompress data until either the input buffer is empty or the output buffer is full. The *stream* references a z\_stream structure. Before the first call to inflate(), this structure should have been initialized by a call to inflateInit2\_().

**Note:** inflateInit2\_() is only in the binary standard; source level applications should initialize *stream* via a call to inflateInit() or inflateInit2().

In addition, the *stream* input and output buffers should have been initialized as follows:

```
next_in
```

should point to the data to be decompressed.

avail\_in

should contain the number of bytes of data in the buffer referenced by *next\_in*.

next\_out

should point to a buffer where decompressed data may be placed.

avail\_out

should contain the size in bytes of the buffer referenced by next\_out

The inflate() function shall perform one or both of the following actions:

- 1. Decompress input data from *next\_in* and update *next\_in*, *avail\_in* and *total\_in* to reflect the data that has been decompressed.
- 2. Fill the output buffer referenced by next\_out, and update next\_out, avail\_out, and total\_out to reflect the decompressed data that has been placed there. If flush is not Z\_NO\_FLUSH, and avail\_out indicates that there is still space in output buffer, this action shall always occur (see below for further details).

The inflate() function shall return when either <code>avail\_in</code> reaches zero (indicating that all the input data has been compressed), or <code>avail\_out</code> reaches zero (indicating that the output buffer is full).

#### **Flush Operation**

The parameter *flush* determines when uncompressed bytes are added to the output buffer in *next\_out*. If *flush* is Z\_NO\_FLUSH, inflate() may return with some data pending output, and not yet added to the output buffer.

If *flush* is Z\_SYNC\_FLUSH, inflate() shall flush all pending output to *next\_out*, and update *next\_out* and *avail\_out* accordingly.

If *flush* is set to Z\_BLOCK, inflate() shall stop adding data to the output buffer if and when the next compressed block boundary is reached (see <u>RFC 1951: DEFLATE Compressed Data Format Specification</u>).

If *flush* is set to Z\_FINISH, all of the compressed input shall be decompressed and added to the output. If there is insufficient output space (i.e. the compressed input data uncompresses to more than *avail\_out* bytes), then inflate() shall fail and return Z\_BUF\_ERROR.

### **Return Value**

On success, inflate() shall return Z\_OK if decompression progress has been made, or Z\_STREAM\_END if all of the input data has been decompressed and there was sufficient space in the output buffer to store the uncompressed result. On error, inflate() shall return a value to indicate the error.

**Note:** If inflate() returns Z\_OK and has set  $avail\_out$  to zero, the function should be called again with the same value for flush, and with updated  $next\_out$  and  $avail\_out$  until inflate() returns with either Z\_OK or Z\_STREAM\_END and a non-zero  $avail\_out$ .

On success, inflate() shall set the *adler* to the Adler-32 checksum of the output produced so far (i.e. *total\_out* bytes).

### **Errors**

On error, inflate() shall return a value as described below, and may set the *msg* field of *stream* to point to a string describing the error:

#### Z\_BUF\_ERROR

No progress is possible; either avail\_in or avail\_out was zero.

#### Z\_MEM\_ERROR

Insufficient memory.

#### Z\_STREAM\_ERROR

The state (as represented in stream) is inconsistent, or stream was NULL.

### Z\_NEED\_DICT

A preset dictionary is required. The *adler* field shall be set to the Adler-32 checksum of the dictionary chosen by the compressor.

### inflateEnd

### Name

inflateEnd — free decompression stream state

# **Synopsis**

```
#include <zlib.h>
int inflateEnd(z_streamp stream);
```

# **Description**

The inflateEnd() function shall free all allocated state information referenced by *stream*. All pending output is discarded, and unprocessed input is ignored.

## **Return Value**

On success, inflateEnd() shall return Z\_OK. Otherwise it shall return Z\_STREAM\_ERROR to indicate the error.

## **Errors**

On error, inflateEnd() shall return Z\_STREAM\_ERROR. The following conditions shall be treated as an error:

- The state in *stream* is inconsistent.
- stream is NULL.
- The zfree function pointer is NULL.

### inflateInit2

#### **Name**

inflateInit2\_ — initialize decompression system

# **Synopsis**

```
#include <zlib.h>
  int inflateInit2_ (z_streamp strm, int windowBits, char * version,
int stream_size);
```

# **Description**

The inflateInit2\_() function shall initialize the decompression system. On entry, *strm* shall refer to a user supplied z\_stream object (a z\_stream\_s structure). The following fields shall be set on entry:

#### zalloc

a pointer to an alloc\_func function, used to allocate state information. If this is NULL, a default allocation function will be used.

#### zfree

a pointer to a free\_func function, used to free memory allocated by the *zalloc* function. If this is NULL a default free function will be used.

#### opaque

If alloc\_func is not NULL, opaque is a user supplied pointer to data that will be passed to the alloc\_func and free\_func functions.

If the *version* requested is not compatible with the version implemented, or if the size of the z\_stream\_s structure provided in *stream\_size* does not match the size in the library implementation, inflateInit2\_() shall fail, and return Z\_VERSION\_ERROR.

The windowBits parameter shall be a base 2 logarithm of the maximum window size to use, and shall be a value between 8 and 15. If the input data was compressed with a larger window size, subsequent attempts to decompress this data will fail with Z\_DATA\_ERROR, rather than try to allocate a larger window.

The inflateInit2\_() function is not in the source standard; it is only in the binary standard. Source applications should use the inflateInit2() macro.

### **Return Value**

On success, the inflateInit2\_() function shall return Z\_OK. Otherwise, inflateInit2\_() shall return a value as described below to indicate the error.

### **Errors**

On error, inflateInit2\_() shall return one of the following error indicators:

#### Z\_STREAM\_ERROR

Invalid parameter.

#### Z\_MEM\_ERROR

Insufficient memory available.

Z\_VERSION\_ERROR

The version requested is not compatible with the library version, or the  $z\_stream$  size differs from that used by the library.

In addition, the msg field of the strm may be set to an error message.

## inflateInit\_

#### **Name**

inflateInit\_ — initialize decompression system

# **Synopsis**

```
#include <zlib.h>
int inflateInit_(z_streamp stream, const char * version, int
stream_size);
```

# **Description**

The inflateInit\_() function shall initialize the decompression system. On entry, *stream* shall refer to a user supplied z\_stream object (a z\_stream\_s structure). The following fields shall be set on entry:

zalloc

a pointer to an alloc\_func function, used to allocate state information. If this is NULL, a default allocation function will be used.

zfree

a pointer to a free\_func function, used to free memory allocated by the *zalloc* function. If this is NULL a default free function will be used.

opaque

If alloc\_func is not NULL, opaque is a user supplied pointer to data that will be passed to the alloc\_func and free\_func functions.

If the *version* requested is not compatible with the version implemented, or if the size of the z\_stream\_s structure provided in *stream\_size* does not match the size in the library implementation, inflateInit\_() shall fail, and return Z\_VERSION\_ERROR.

The inflateInit\_() function is not in the source standard; it is only in the binary standard. Source applications should use the inflateInit() macro.

The inflateInit\_() shall be equivalent to

inflateInit2\_(strm, MAX\_WBITS, version, stream\_size);

#### Return Value

On success, the inflateInit\_() function shall return Z\_OK. Otherwise, inflateInit\_() shall return a value as described below to indicate the error.

#### **Errors**

On error,  $inflateInit_()$  shall return one of the following error indicators:

Z\_STREAM\_ERROR

Invalid parameter.

Z\_MEM\_ERROR

Insufficient memory available.

Z VERSION ERROR

The version requested is not compatible with the library version, or the z\_stream size differs from that used by the library.

In addition, the *msg* field of the *strm* may be set to an error message.

### inflateReset

### **Name**

inflateReset — reset decompression stream state

# **Synopsis**

```
#include <zlib.h>
int inflateReset(z_streamp stream);
```

# **Description**

The inflateReset() function shall reset all state associated with *stream*. All pending output shall be discarded, and the counts of processed bytes (*total\_in* and *total\_out*) shall be reset to zero.

## **Return Value**

On success, inflateReset() shall return Z\_OK. Otherwise it shall return Z\_STREAM\_ERROR to indicate the error.

## **Errors**

On error, inflateReset() shall return Z\_STREAM\_ERROR. The following conditions shall be treated as an error:

- The state in *stream* is inconsistent or inappropriate.
- stream is NULL.

## inflateSetDictionary

#### **Name**

inflateSetDictionary — initialize decompression dictionary

# **Synopsis**

```
#include <zlib.h>
int inflateSetDictionary(z_streamp stream, const Bytef * dictionary,
uInt dictlen);
```

# **Description**

The inflateSetDictionary() function shall initialize the decompression dictionary associated with *stream* using the *dictlen* bytes referenced by *dictionary*.

The inflateSetDictionary() function should be called immediately after a call to inflate() has failed with return value Z\_NEED\_DICT. The *dictionary* must have the same Adler-32 checksum as the dictionary used for the compression (see deflate-SetDictionary()).

stream shall reference an initialized decompression stream, with total\_in zero (i.e. no data has been decompressed since the stream was initialized).

### **Return Value**

On success, inflateSetDictionary() shall return Z\_OK. Otherwise it shall return a value as indicated below.

## **Errors**

On error, inflateSetDictionary() shall return a value as described below:

Z\_STREAM\_ERROR

The state in stream is inconsistent, or stream was NULL.

Z\_DATA\_ERROR

The Adler-32 checksum of the supplied dictionary does not match that used for the compression.

# **Application Usage (informative)**

The application should provide a dictionary consisting of strings {{{ed note: do we really mean "strings"? Null terminated?}}} that are likely to be encountered in the data to be compressed. The application should ensure that the dictionary is sorted such that the most commonly used strings occur at the end of the dictionary.

The use of a dictionary is optional; however if the data to be compressed is relatively short and has a predictable structure, the use of a dictionary can substantially improve the compression ratio.

## inflateSync

### **Name**

inflateSync — advance compression stream to next sync point

# **Synopsis**

```
#include <zlib.h>
int inflateSync(z_streamp stream);
```

# **Description**

The inflateSync() function shall advance through the compressed data in *stream*, skipping any invalid compressed data, until the next full flush point is reached, or all input is exhausted. See the description for deflate() with flush level Z\_FULL\_FLUSH. No output is placed in *next\_out*.

## **Return Value**

On success, inflateSync() shall return Z\_OK, and update the <code>next\_in</code>, <code>avail\_in</code>, and <code>total\_in</code> fields of <code>stream</code> to reflect the number of bytes of compressed data that have been skipped. Otherwise, inflateSync() shall return a value as described below to indicate the error.

### **Errors**

On error, inflateSync() shall return a value as described below:

#### Z\_STREAM\_ERROR

The state (as represented in stream) is inconsistent, or stream was NULL.

### Z\_BUF\_ERROR

There is no data available to skip over.

#### Z\_DATA\_ERROR

No sync point was found.

# inflateSyncPoint

### **Name**

inflateSyncPoint — test for synchronization point

# **Synopsis**

```
#include <zlib.h>
int inflateSyncPoint(z_streamp stream);
```

# **Description**

The inflateSyncPoint() function shall return a non-zero value if the compressed data stream referenced by *stream* is at a synchronization point.

## **Return Value**

If the compressed data in *stream* is at a synchronization point (see deflate() with a flush level of Z\_SYNC\_FLUSH or Z\_FULL\_FLUSH), inflateSyncPoint() shall return a non-zero value, other than Z\_STREAM\_ERROR. Otherwise, if the *stream* is valid, inflateSyncPoint() shall return 0. If *stream* is invalid, or in an invalid state, inflateSyncPoint() shall return Z\_STREAM\_ERROR to indicate the error.

### **Errors**

On error, inflateSyncPoint() shall return a value as described below:

Z\_STREAM\_ERROR

The state (as represented in stream) is inconsistent, or stream was NULL.

### uncompress

### **Name**

uncompress — uncompress data

# **Synopsis**

```
#include <zlib.h>
int uncompress(Bytef * dest, uLongf * destLen, const Bytef * source,
uLong sourceLen);
```

# **Description**

The uncompress() function shall attempt to uncompress *sourceLen* bytes of data in the buffer *source*, placing the result in the buffer *dest*.

On entry, *destLen* should point to a value describing the size of the *dest* buffer. The application should ensure that this value is large enough to hold the entire uncompressed data.

**Note:** The LSB does not describe any mechanism by which a compressor can communicate the size required to the uncompressor.

On successful exit, the variable referenced by *destLen* shall be updated to hold the length of uncompressed data in *dest*.

### **Return Value**

On success, uncompress() shall return Z\_OK. Otherwise, uncompress() shall return a value to indicate the error.

#### **Errors**

On error, uncompress() shall return a value as described below:

```
Z_BUF_ERROR
```

The buffer dest was not large enough to hold the uncompressed data.

#### Z\_MEM\_ERROR

Insufficient memory.

### Z\_DATA\_ERROR

The compressed data (referenced by source) was corrupted.

#### **z**Error

### **Name**

zError — translate error number to string

# **Synopsis**

```
#include <zlib.h>
const char * zError(int err);
```

# **Description**

The zError() function shall return the string identifying the error associated with *err*. This allows for conversion from error code to string for functions such as compress() and uncompress(), that do not always set the string version of an error.

### **Return Value**

The zError() function shall return a the string identifying the error associated with *err*, or NULL if *err* is not a valid error code.

It is unspecified if the string returned is determined by the setting of the LC\_MESSAGES category in the current locale.

#### **Errors**

None defined.

### zlibVersion

#### Name

zlibVersion — discover library version at run time

# **Synopsis**

```
#include <zlib.h>
const char * zlibVersion (void);
```

# **Description**

The zlibVersion() function shall return the string identifying the interface version at the time the library was built.

Applications should compare the value returned from zlibVersion() with the macro constant ZLIB\_VERSION for compatibility.

### **Return Value**

The zlibVersion() function shall return a the string identifying the version of the library currently implemented.

#### **Errors**

None defined.

## 15.5 Interfaces for libncurses

Table 15-3 defines the library name and shared object name for the library

**Table 15-3 libncurses Definition** 

Library:	libncurses
SONAME:	libncurses.so.5

The parameters or return types of the following interfaces have had the const qualifier added as shown here, as compared to the specification in X/Open Curses, Issue 7.

```
extern const char *keyname (int);
extern SCREEN *newterm (const char *, FILE *, FILE *);
extern const char *unctrl (chtype);

extern int mvprintw (int, int, const char *, ...);
extern int mvwprintw (WINDOW *, int, int, const char *, ...);
extern int printw (const char *, ...);
extern int vwprintw (WINDOW *, const char *, va_list);
extern int vw_printw (WINDOW *, const char *, va_list);
extern int mvscanw (int, int, const char *, ...);
extern int mvscanw (WINDOW *, int, int, const char *, ...);
extern int scanw (const char *, ...);
extern int vwscanw (WINDOW *, const char *, va_list);
extern int vwscanw (WINDOW *, const char *, va_list);
extern int wscanw (WINDOW *, const char *, va_list);
extern int wscanw (WINDOW *, const char *, ...);
```

The behavior of the interfaces in this library is specified by the following specifications: [LSB] This Specification

[X-CURSES] X/Open Curses, Issue 7

### 15.5.1 Curses

#### 15.5.1.1 Interfaces for Curses

An LSB conforming implementation shall provide the generic functions for Curses specified in <u>Table 15-4</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 15-4 libncurses - Curses Function Interfaces** 

addch [X-	addchnstr [X-	addchstr [X-	addnstr [X-

An LSB conforming implementation shall provide the generic deprecated functions for Curses specified in <u>Table 15-5</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Note:** These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.

**Table 15-5 libncurses - Curses Deprecated Function Interfaces**

## 15.6 Data Definitions for libncurses

This section defines global identifiers and their values that are associated with interfaces contained in libncurses. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

```

### 15.7 Interface Definitions for libncurses

The interfaces defined on the following pages are included in libnourses and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 15.5</u> shall behave as described in the referenced base document.

#### inchnstr

### **Name**

inchnstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int inchnstr(chtype * chstr, int n);
```

# **Description**

The interface inchnstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that inchnstr() shall return the number of characters that were read.

## inchstr

### Name

inchstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int inchstr(chtype * chstr);
```

# **Description**

The interface inchstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that inchstr() shall return the number of characters that were read.

#### instr

#### Name

instr — obtain a string of characters from a curses window

# **Synopsis**

```
#include <curses.h>
int instr(char * str);
```

# **Description**

The interface instr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that instr() shall return the number of characters that were read.

#### mvcur

### Name

mvcur — send cursor movement commands to terminal

# **Synopsis**

```
#include <curses.h>
int mvcur(int oldrow, int oldcol, int newrow, int newcol);
```

# **Description**

The interface mvcur() shall behave as described in <u>X/Open Curses</u>, <u>Issue 7</u>, except that if (*newrow*, *newco1*) is not a valid address for the terminal in use, the results of the mvcur() function are unspecified.

### mvinchnstr

## **Name**

mvinchnstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int mvinchnstr(int y, int x, chtype * chstr, int n);
```

# **Description**

The interface mvinchnstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that mvinchnstr() shall return the number of characters that were read.

### mvinchstr

### **Name**

mvinchstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int mvinchstr(int y, int x, chtype * chstr);
```

# **Description**

The interface mvinchstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that mvinchstr() shall return the number of characters that were read.

#### mvinstr

#### **Name**

mvinstr — obtain a string of characters from a curses window

# **Synopsis**

```
#include <curses.h>
int mvinstr(int y, int x, char * str);
```

# **Description**

The interface mvinstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that mvinstr() shall return the number of characters that were read.

### mvscanw

### Name

mvscanw — convert formatted input from a curses window

# **Synopsis**

```
#include <curses.h>
int mvscanw(int y, int x, const char *fmt, ...);
```

# **Description**

The scanw family of functions shall behave as described in  $\underline{X/Open Curses}$ , Issue 7, except as noted below.

#### **Differences**

This function returns ERR on failure. On success it returns the number of successfully matched and assigned input items. This differs from  $\underline{X/Open\ Curses}$ , Issue 7, which indicates this function returns 0K on success.

#### mywinchnstr

#### **Name**

mvwinchnstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int mvwinchnstr(WINDOW * win, int y, int x, chtype * chstr, int n);
```

# **Description**

The interface mvwinchnstr() shall behave as specified in X/Open Curses, Issue 7, except that mvwinchnstr() shall return the number of characters that were read.

#### mvwinchstr

### **Name**

mvwinchstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int mvwinchstr(WINDOW * win, int y, int x, chtype * chstr);
```

# **Description**

The interface mvwinchstr() shall behave as specified in X/Open Curses, Issue 7, except that mvwinchstr() shall return the number of characters that were read.

### mvwinstr

### **Name**

mvwinstr — obtain a string of characters from a curses window

# **Synopsis**

```
#include <curses.h>
int mvwinstr(WINDOW * win, int y, int x, char * str);
```

# **Description**

The interface mvwinstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that mvwinstr() shall return the number of characters that were read.

#### mvwscanw

#### Name

mvwscanw — convert formatted input from a curses window

# **Synopsis**

```
#include <curses.h>
int mvwscanw(WINDOW *win, int y, int x, const char *fmt, ...);
```

# **Description**

The scanw family of functions shall behave as described in  $\underline{X/Open\ Curses}$ , Issue 7, except as noted below.

#### **Differences**

This function returns ERR on failure. On success it returns the number of successfully matched and assigned input items. This differs from <u>X/Open Curses</u>, <u>Issue 7</u>, which indicates this function returns **OK** on success.

# ripoffline

### Name

ripoffline — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int ripoffline(int line, int (*init) (WINDOW *, int));
```

# **Description**

The interface ripoffline() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that ripoffline() shall return -1 if the number of lines that were ripped off exceeds five.

#### scanw

### Name

scanw — convert formatted input from a curses window

# **Synopsis**

```
#include <curses.h>
int scanw(const char *fmt, ...);
```

# **Description**

The scanw family of functions shall behave as described in  $\underline{X/Open\ Curses}$ , Issue 7, except as noted below.

### **Differences**

This function returns ERR on failure. On success it returns the number of successfully matched and assigned input items. This differs from  $\underline{X/Open\ Curses}$ , Issue 7, which indicates this function returns 0K on success.

#### vw\_scanw

#### Name

vw\_scanw — convert formatted input from a curses window

# **Synopsis**

```
#include <curses.h>
int vw_scanw(WINDOW *win, const char *fmt, va_list vararglist);
```

# **Description**

The scanw family of functions shall behave as described in  $\underline{X/Open Curses}$ , Issue 7, except as noted below.

## **Differences**

This function returns ERR on failure. On success it returns the number of successfully matched and assigned input items. This differs from  $\underline{X/Open\ Curses}$ , Issue 7, which indicates this function returns 0K on success.

#### vwscanw

### **Name**

vwscanw — convert formatted input from a curses window

# **Synopsis**

```
#include <curses.h>
int vw_scanw(WINDOW *win, const char *fmt, va_list vararglist);
```

# **Description**

The scanw family of functions shall behave as described in  $\underline{X/Open\ Curses}$ , Issue 7, except as noted below.

### **Differences**

This function returns ERR on failure. On success it returns the number of successfully matched and assigned input items. This differs from <u>X/Open Curses</u>, <u>Issue 7</u>, which indicates this function returns 0K on success.

### winchnstr

#### Name

winchnstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int winchnstr(WINDOW * win, chtype * chstr, int n);
```

# **Description**

The interface winchnstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that winchnstr() shall return the number of characters that were read.

#### winchstr

### **Name**

winchstr — obtain a string of characters and their attributes from a curses window

# **Synopsis**

```
#include <curses.h>
int winchstr(WINDOW * win, chtype * chstr);
```

# **Description**

The interface winchstr() shall behave as specified in <u>X/Open Curses</u>, <u>Issue 7</u>, except that winchstr() shall return the number of characters that were read.

### winstr

### **Name**

winstr — obtain a string of characters from a curses window

# **Synopsis**

```
#include <curses.h>
int winstr(WINDOW * win, char * str);
```

# **Description**

The interface winstr() shall behave as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that winstr() shall return the number of characters that were read.

#### wscanw

#### Name

wscanw — convert formatted input from a curses window

# **Synopsis**

```
#include <curses.h>
int wscanw(WINDOW *win, const char *fmt, ...);
```

# **Description**

The scanw family of functions shall behave as described in  $\underline{X/Open\ Curses}$ , Issue 7, except as noted below.

#### **Differences**

This function returns ERR on failure. On success it returns the number of successfully matched and assigned input items. This differs from  $\underline{X/Open\ Curses}$ , Issue 7, which indicates this function returns 0K on success.

## 15.8 Interfaces for libncursesw

Table 15-7 defines the library name and shared object name for the libraryses wibrary

**Table 15-7 libncursesw Definition** 

Library:	libncursesw
SONAME:	libncursesw.so.5

The behavior of the interfaces in this library is specified by the following specifications:

[Libncursesw] <u>Libncursesw API</u>

[LSB] This Specification

[ncursesw] <u>Libncursesw Placeholder</u>

[X-CURSES] X/Open Curses, Issue 7

## 15.8.1 Curses Wide

### 15.8.1.1 Interfaces for Curses Wide

An LSB conforming implementation shall provide the generic functions for Curses Wide specified in <u>Table 15-8</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 15-8 libncursesw - Curses Wide Function Interfaces** 

add_wch [Libncursesw]	add_wchnstr [Libncursesw]	add_wchstr [Libncursesw]	addch [Libncursesw]

stdscr [ncursesw]	ttytype [ncursesw]		

## 15.9 Data Definitions for libncursesw

This section defines global identifiers and their values that are associated with interfaces contained in libncursesw. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not

preclude their use by other programming languages.

# 15.9.1 ncursesw/curses.h

```
#define CURSES 1
                        do { if (newscr) { \

### 15.9.4 ncursesw/unctrl.h

### 15.10 Interface Definitions for libncursesw

The interfaces defined on the following pages are included in libncursesw and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 15.8</u> shall behave as described in the referenced base document.

### 15.11 Interfaces for libutil

<u>Table 15-11</u> defines the library name and shared object name for the libutil library

**Table 15-11 libutil Definition** 

Library:	libutil
SONAME:	libutil.so.1

The behavior of the interfaces in this library is specified by the following specifications: [LSB] This Specification

# 15.11.1 Utility Functions

### 15.11.1.1 Interfaces for Utility Functions

An LSB conforming implementation shall provide the generic functions for Utility Functions specified in <u>Table 15-12</u>, with the full mandatory functionality as described in the referenced underlying specification.

**Table 15-12 libutil - Utility Functions Function Interfaces** 

forkpty [LSB]	login [LSB]	login_tty [LSB]	logout [LSB]
logwtmp [LSB]	openpty [LSB]		

### 15.12 Data Definitions for libutil

This section defines global identifiers and their values that are associated with interfaces contained in libutil. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

# 15.12.1 pty.h

### 15.13 Interface Definitions for libutil

The interfaces defined on the following pages are included in libutil and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in <u>Section 15.11</u> shall behave as described in the referenced base document.

# forkpty

### **Name**

forkpty — Create a new process attached to an available pseudo-terminal

# **Synopsis**

```
#include <pty.h>
int forkpty(int * amaster, char * name, const struct termios * termp,
const struct winsize * winp);
```

# **Description**

The forkpty() function shall find and open a pseudo-terminal device pair in the same manner as the openpty() function. If a pseudo-terminal is available, forkpty() shall create a new process in the same manner as the fork() function, and prepares the new process for login in the same manner as login\_tty().

If *termp* is not null, it shall refer to a termios structure that shall be used to initialize the characteristics of the slave device. If *winp* is not null, it shall refer to a winsize structure used to initialize the window size of the slave device.

### **Return Value**

On success, the parent process shall return the process id of the child, and the child shall return 0. On error, no new process shall be created, -1 shall be returned, and errno shall be set appropriately. On success, the parent process shall receive the file descriptor of the master side of the pseudo-terminal in the location referenced by *amaster*, and, if *name* is not NULL, the filename of the slave device in *name*.

### **Errors**

**EAGAIN** 

Unable to create a new process.

**ENOENT** 

There are no available pseudo-terminals.

**ENOMEM** 

Insufficient memory was available.

# login

### **Name**

login — login utility function

# **Synopsis**

```
#include <utmp.h>
void login (struct utmp * ut );
```

# **Description**

The login() function shall update the user accounting databases. The *ut* parameter shall reference a utmp structure for all fields except the following:

- 1. The *ut\_type* field shall be set to USER\_PROCESS.
- 2. The *ut\_pid* field shall be set to the process identifier for the current process.
- 3. The *ut\_line* field shall be set to the name of the controlling terminal device. The name shall be found by examining the device associated with the standard input, output and error streams in sequence, until one associated with a terminal device is found. If none of these streams refers to a terminal device, the *ut\_line* field shall be set to "???". If the terminal device is in the /dev directory hierarchy, the *ut\_line* field shall not contain the leading "/dev/", otherwise it shall be set to the final component of the pathname of the device. If the user accounting database imposes a limit on the size of the *ut\_line* field, it shall truncate the name, but any such limit shall not be smaller than UT\_LINESIZE (including a terminating null character).

# **Return Value**

None

#### **Errors**

None

# login\_tty

### **Name**

login\_tty — Prepare a terminal for login

# **Synopsis**

```
#include <utmp.h>
int login_tty (int fdr);
```

# **Description**

The login\_tty() function shall prepare the terminal device referenced by the file descriptor fdr. This function shall create a new session, make the terminal the controlling terminal for the current process, and set the standard input, output, and error streams of the current process to the terminal. If fdr is not the standard input, output or error stream, then login\_tty() shall close fdr.

### **Return Value**

On success, login\_tty() shall return zero; otherwise -1 is returned, and errno shall be set appropriately.

### **Errors**

**ENOTTY** 

fdr does not refer to a terminal device.

# logout

#### Name

logout — logout utility function

# **Synopsis**

```
#include <utmp.h>
int logout (const char * line );
```

# **Description**

Given the device *line*, the logout() function shall search the user accounting data-base which is read by getutent() for an entry with the corresponding line, and with the type of USER\_PROCESS. If a corresponding entry is located, it shall be updated as follows:

- 1. The ut\_name field shall be set to zeroes (UT\_NAMESIZE NUL bytes).
- 2. The ut\_host field shall be set to zeroes (UT\_HOSTSIZE NUL bytes).
- 3. The ut\_tv shall be set to the current time of day.
- 4. The ut\_type field shall be set to DEAD\_PROCESS.

### **Return Value**

On success, the logout() function shall return non-zero. Zero is returned if there was no entry to remove, or if the utmp file could not be opened or updated.

# logwtmp

### **Name**

logwtmp — append an entry to the wtmp file

# **Synopsis**

```
#include <utmp.h>
void logwtmp (const char * line , const char * name , const char *
host );
```

# **Description**

If the process has permission to update the user accounting databases, the logwtmp() function shall append a record to the user accounting database that records all logins and logouts. The record to be appended shall be constructed as follows:

- The ut\_line field shall be initialized from line. If the user accounting database imposes a limit on the size of the ut\_line field, it shall truncate the value, but any such limit shall not be smaller than UT\_LINESIZE (including a terminating null character).
- 2. The ut\_name field shall be initialized from name. If the user accounting database imposes a limit on the size of the ut\_name field, it shall truncate the value, but any such limit shall not be smaller than UT\_NAMESIZE (including a terminating null character).
- 3. The ut\_host field shall be initialized from *host*. If the user accounting database imposes a limit on the size of the *ut\_host* field, it shall truncate the value, but any such limit shall not be smaller than UT\_HOSTSIZE (including a terminating null character).
- 4. If the name parameter does not refer to an empty string (i.e. ""), the ut\_type field shall be set to USER\_PROCESS; otherwise the ut\_type field shall be set to DEAD\_PROCESS.
- 5. The ut\_id field shall be set to the process identifier for the current process.
- 6. The ut\_tv field shall be set to the current time of day.

**Note:** If a process does not have write access to the user accounting database, the log-wtmp() function will not update it. Since the function does not return any value, an application has no way of knowing whether it succeeded or failed.

#### Return Value

None.

# openpty

### Name

openpty — find and open an available pseudo-terminal

# **Synopsis**

```
#include <pty.h>
int openpty(int *amaster, int *aslave, char *name, const struct
termios *termp, const struct winsize *winp);
```

# **Description**

The openpty() function shall find an available pseudo-terminal and return file descriptors for the master and slave devices in the locations referenced by <code>amaster</code> and <code>aslave</code> respectively. If <code>name</code> is not NULL, the filename of the slave shall be placed in the user supplied buffer referenced by <code>name</code>. If <code>termp</code> is not NULL, it shall point to a <code>termios</code> structure used to initialize the terminal parameters of the slave pseudo-terminal device. If <code>winp</code> is not NULL, it shall point to a <code>winsize</code> structure used to initialize the window size parameters of the slave pseudo-terminal device.

### **Return Value**

On success, zero is returned. On error, -1 is returned, and errno is set appropriately.

### **Errors**

**ENOENT** 

There are no available pseudo-terminals.

# V C++ Libraries

# 16 Libraries

An LSB-conforming implementation shall support some C++ libraries which provide interfaces for accessing the operating system, processor and other hardware in the system.

### 16.1 Interfaces for libstdcxx

Table 16-1 defines the library name and shared object name for the libstdcxx library

#### **Table 16-1 libstdcxx Definition**

Library:	libstdcxx
SONAME:	libstdc++.so.6

Unless stated otherwise, all symbols are in the std:: namespace.

The behavior of the interfaces in this library is specified by the following specifications: [CXXABI-1.86] <u>Itanium<sup>TM</sup> C++ ABI</u> [ISOCXX] <u>ISO/IEC 14882: 2003 C++ Language</u> [LSB] <u>This Specification</u>

# 16.1.1 C++ Runtime Support

# 16.1.1.1 Interfaces for C++ Runtime Support

An LSB conforming implementation shall provide the generic methods for C++ Runtime Support specified in <u>Table 16-2</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-2 libstdcxx - C++ Runtime Support Function Interfaces

gnu_cxx::atomic_add(int volatile*, int)(GLIBCXX_3.4) [CXXABI-1.86]

### 16.1.40 struct numeric\_limits<short>

#### 16.1.40.1 Interfaces for struct numeric\_limits<short>

No external methods are defined for libstdcxx - struct numeric\_limits<short> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric\_limits<short> specified in <u>Table 16-121</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-121 libstdcxx - struct numeric\_limits<short> Data Interfaces

numeric_limits <short>::has_denorm(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::is_bounded(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::is_integer(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::round_style(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::has_infinity(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::max_exponent(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::min_exponent(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::is_specialized(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::max_exponent10(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::min_exponent10(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::tinyness_before(GLIBCXX_3.4) [ISOCXX]</short>
numeric_limits <short>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]</short>

numeric_limits <unsigned long="">::digits(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned long="">::digits10(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned long="">::is_exact(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned long="">::is_iec559(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned long="">::is_modulo(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned long="">::is_signed(GLIBCXX_3.4) [ISOCXX]</unsigned>

### 16.1.46 struct numeric\_limits<wchar\_t>

#### 16.1.46.1 Interfaces for struct numeric\_limits<wchar\_t>

No external methods are defined for libstdcxx - struct numeric\_limits<wchar\_t> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric\_limits<wchar\_t> specified in <u>Table 16-127</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-127 libstdcxx - struct numeric\_limits<wchar\_t> Data Interfaces

numeric_limits <wchar_t>::has_denorm(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::is_bounded(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::is_integer(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::round_style(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::has_infinity(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::max_exponent(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::min_exponent(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::is_specialized(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::max_exponent10(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::min_exponent10(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::tinyness_before(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::radix(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::traps(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::digits(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::digits10(GLIBCXX_3.4) [ISOCXX]</wchar_t>

numeric_limits <wchar_t>::is_exact(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::is_iec559(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::is_modulo(GLIBCXX_3.4) [ISOCXX]</wchar_t>
numeric_limits <wchar_t>::is_signed(GLIBCXX_3.4) [ISOCXX]</wchar_t>

### 16.1.47 struct numeric\_limits<unsigned char>

#### 16.1.47.1 Interfaces for struct numeric\_limits<unsigned char>

No external methods are defined for libstdcxx - struct numeric\_limits<unsigned char> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric\_limits<unsigned char> specified in <u>Table 16-128</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-128 libstdcxx - struct numeric\_limits<unsigned char> Data Interfaces

numeric_limits <unsigned char="">::has_denorm(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned char="">::is_bounded(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned char="">::is_integer(GLIBCXX_3.4) [ISOCXX]</unsigned>
numeric_limits <unsigned char="">::round_style(GLIBCXX_3.4) [ISOCXX]</unsigned>

### 16.1.49 struct numeric\_limits<char>

#### 16.1.49.1 Interfaces for struct numeric\_limits<char>

No external methods are defined for libstdcxx - struct numeric\_limits<char> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric\_limits<char> specified in <u>Table 16-130</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-130 libstdcxx - struct numeric\_limits<char> Data Interfaces

numeric_limits <char>::has_denorm(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::is_bounded(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::is_integer(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::round_style(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::has_infinity(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::max_exponent(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::min_exponent(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::is_specialized(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::max_exponent10(GLIBCXX_3.4) [ISOCXX]</char>

numeric_limits <char>::min_exponent10(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::tinyness_before(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::radix(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::traps(GLIBCXX_3.4) [ISOCXX]</char>

numeric_limits <char>::is_modulo(GLIBCXX_3.4) [ISOCXX]</char>
numeric_limits <char>::is_signed(GLIBCXX_3.4) [ISOCXX]</char>

### 16.1.50 struct numeric\_limits<bool>

### 16.1.50.1 Interfaces for struct numeric\_limits<bool>

No external methods are defined for libstdcxx - struct numeric\_limits<bool> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric\_limits<br/>bool> specified in <u>Table 16-131</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-131 libstdcxx - struct numeric\_limits<br/>bool> Data Interfaces

numeric_limits <bool>::is_bounded(GLIBCXX_3.4) [ISOCXX] numeric_limits<bool>::is_integer(GLIBCXX_3.4) [ISOCXX] numeric_limits<bool>::round_style(GLIBCXX_3.4) [ISOCXX] numeric_limits<bool>::max_exponent(GLIBCXX_3.4) [ISOCXX] numeric_limits<bool>::max_exponent(GLIBCXX_3.4) [ISOCXX] numeric_limits<bool>::min_exponent(GLIBCXX_3.4) [ISOCXX] numeric_limits<bool>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX] numeric_limits<bool>::is_specialized(GLIBCXX_3.4) [ISOCXX]</bool></bool></bool></bool></bool></bool></bool></bool>

### 16.1.148.1 Interfaces for Class \_\_gnu\_cxx::free\_list

An LSB conforming implementation shall provide the generic methods for Class \_\_gnu\_cxx::free\_list specified in <u>Table 16-439</u>, with the full mandatory functionality as described in the referenced underlying specification.

#### Table 16-439 libstdcxx - Class \_\_gnu\_cxx::free\_list Function Interfaces

\_\_gnu\_cxx::free\_list::\_M\_clear()(GLIBCXX\_3.4.4) [LSB]

# 16.1.149 Class char\_traits<char>

### 16.1.149.1 Interfaces for Class char traits<char>

An LSB conforming implementation shall provide the generic methods for Class std::char\_traits<char> specified in <u>Table 16-440</u>, with the full mandatory functionality as described in the referenced underlying specification.

### Table 16-440 libstdcxx - Class char\_traits<char> Function Interfaces

char\_traits<char>::eq(char const&, char const&)(GLIBCXX\_3.4.5) [ISOCXX]

# 16.1.150 Class char\_traits<wchar\_t>

### 16.1.150.1 Interfaces for Class char\_traits<wchar\_t>

An LSB conforming implementation shall provide the generic methods for Class std::char\_traits<wchar\_t> specified in <u>Table 16-441</u>, with the full mandatory functionality as described in the referenced underlying specification.

#### Table 16-441 libstdcxx - Class char\_traits<wchar\_t> Function Interfaces

char\_traits<wchar\_t>::eq(wchar\_t const&, wchar\_t const&)(GLIBCXX\_3.4.5)
[ISOCXX]

# **16.2 Interface Definitions for libstdcxx**

The interfaces defined on the following pages are included in libstdcxx and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in  $\underline{\text{Section 16.1}}$  shall behave as described in the referenced base document.

# **VI Commands and Utilities**

### 17 Commands and Utilities

### 17.1 Commands and Utilities

An LSB conforming implementation shall provide the commands and utilities as described in <u>Table 17-1</u>, with at least the behavior described as mandatory in the referenced underlying specification, with the following exceptions:

1. If any operand (except one which follows --) starts with a hyphen, the behavior is unspecified.

Rationale (Informative): Applications should place options before operands, or use --, as needed. This text is needed because, by default, GNU option parsing differs from POSIX, unless the environment variable POSIXLY\_CORRECT is set. For example, ls.-a in GNU ls means to list the current directory, showing all files (that is, "." is an operand and -a is an option). In POSIX, "." and -a are both operands, and the command means to list the current directory, and also the file named -a. Suggesting that applications rely on the setting of the POSIXLY\_CORRECT environment variable, or try to set it, seems worse than just asking the applications to invoke commands in ways which work with either the POSIX or GNU behaviors.

**Table 17-1 Commands And Utilities** 

	I	I	I	
[[1]	du [2]	install [2]	mv [1]	strings [1]
ar [2]	echo [2]	install_initd [2]	newgrp [2]	strip [1]
at [2]	ed [1]	ipcrm [2]	nice [1]	stty [1]
awk [2]	egrep [2]	ipcs [2]	nl [1]	su [2]
basename [1]	env [1]	join [1]	nohup [1]	sync [2]

Referenced Specification(s)

- [1]. POSIX 1003.1-2008 (ISO/IEC 9945-2009)
- [2]. This Specification
- [3]. Libncursesw API

An LSB conforming implementation shall provide the shell built in utilities as described in <u>Table 17-2</u>, with at least the behavior described as mandatory in the referenced underlying specification, with the following exceptions:

1. The built in commands and utilities shall be provided by the **sh** utility itself, and need not be implemented in a manner so that they can be accessed via the exec family of functions as defined in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> and should not be invoked directly by those standard utilities that execute other utilities ( **env**, **find**, **nice**, **nohup**, **time**, **xargs**).

**Rationale (Informative):** Since the built in utilities must affect the environment of the calling process, they have no effect when executed as a file.

**Table 17-2 Built In Utilities** 

alias [1]	command [1]	getopts [1]	read [1]	umask [1]
bg [ <u>1</u> ]	fc [1]	hash [1]	type [1]	unalias [1]

Referenced Specification(s)

[1]. POSIX 1003.1-2008 (ISO/IEC 9945-2009)

### 17.2 Command Behavior

This section contains descriptions for commands and utilities whose specified behavior in the LSB contradicts or extends the standards referenced. It also contains commands and utilities only required by the LSB and not specified by other standards.

ar

## Name

ar — create and maintain library archives (DEPRECATED)

# **Description**

 ${f ar}$  is deprecated from the LSB and is expected to disappear from a future version of the LSB.

**Rationale:** The LSB generally does not include software development utilities nor does it specify .o and .a file formats.

**ar** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> but with differences as listed below.

### **Differences**

- -T
- -C

need not be accepted.

-1

has unspecified behavior.

-q

has unspecified behavior; using -r is suggested.

at

### Name

at — examine or delete jobs for later execution

# **Description**

at is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> but with differences as listed below.

### **Differences**

### **Options**

-d

is functionally equivalent to the -r option specified in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009).

-r

need not be supported, but the '-d' option is equivalent.

-t time

need not be supported.

### **Optional Control Files**

The implementation shall support the XSI optional behavior for access control; however the files at.allow and at.deny may reside in /etc rather than /usr/lib/cron.

### awk

### **Name**

awk — pattern scanning and processing language

# **Description**

**awk** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> but with differences as listed below.

### **Differences**

Certain aspects of internationalized regular expressions are optional; see <u>Regular Expressions</u>.

### batch

### **Name**

batch — schedule commands to be executed in a batch queue

## **Description**

The specification for **batch** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Optional Control Files**

The implementation shall support the XSI optional behavior for access control; however the files at.allow and at.deny may reside in /etc rather than /usr/lib/cron.

### bc

### **Name**

bc — an arbitrary precision calculator language

# **Description**

**bc** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> but with extensions as listed below.

### **Extensions**

The bc language may be extended in an implementation defined manner. If an implementation supports extensions, it shall also support the additional options:

```
-s|--standard
```

processes exactly the POSIX bc language.

-w|--warn

gives warnings for extensions to POSIX bc.

### chfn

### Name

chfn — change user name and information

# **Synopsis**

```
chfn [-f full_name] [-h home_phone] [user]
```

# **Description**

**chfn** shall update the user database. An unprivileged user may only change the fields for their own account, a user with appropriate privileges may change the fields for any account

The fields full\_name and home\_phone may contain any character except:

any control character comma colon equal sign

If none of the options are selected, **chfn** operates in an interactive fashion. The prompts and expected input in interactive mode are unspecified and should not be relied upon.

As it is possible for the system to be configured to restrict which fields a non-privileged user is permitted to change, applications should be written to gracefully handle these situations.

# **Standard Options**

-f full\_name
sets the user's full name.

-h home\_phonesets the user's home phone number.

### **Future Directions**

The following two options are expected to be added in a future version of the LSB:

-o office

sets the user's office room number.

-p office\_phone

sets the user's office phone number.

Note that some implementations contain a "-o other" option which specifies an additional field called "other". Traditionally, this field is not subject to the constraints about legitimate characters in fields. Also, one traditionally shall have appropriate privileges to change the other field. At this point there is no consensus about whether it is desirable to specify the other field; applications may wish to avoid using it.

The "-w work\_phone" field found in some implementations should be replaced by the "-p office\_phone" field. The "-r room\_number" field found in some implementations is the equivalent of the "-o office" option mentioned above; which one of these two options to specify will depend on implementation experience and the decision regarding the other field.

### chsh

### **Name**

chsh — change login shell

## **Synopsis**

chsh [-s login\_shell] [user]

# **Description**

**chsh** changes the user login shell. This determines the name of the user's initial login command. An unprivileged user may only change the login shell for their own account, a user with appropriate privilege may change the login shell for any account specified by *user*.

Unless the user has appropriate privilege, the initial login command name shall be one of those listed in /etc/shells. The *login\_shell* shall be the absolute path (i.e. it must start with '/') to an executable file. Accounts which are restricted (in an implementation-defined manner) may not change their login shell.

If the -s option is not selected, **chsh** operates in an interactive mode. The prompts and expected input in this mode are unspecified.

# **Standard Options**

```
-s login_shell sets the login shell.
```

### col

### **Name**

col — filter reverse line feeds from input

# **Description**

col is as specified in SUSv2 but with differences as listed below.

### **Differences**

The -p option has unspecified behavior.

**Note:** Although **col** is shown as legacy in <u>SUSv2</u>, it is not (yet) deprecated in the LSB.

# cpio

### **Name**

cpio — copy file archives in and out

# **Description**

cpio is as specified in SUSv2, but with differences as listed below.

### **Differences**

Some elements of the Pattern Matching Notation are optional; see <u>Pattern Matching Notation</u>.

### crontab

### **Name**

crontab — maintain crontab files for individual users

## **Synopsis**

crontab [-u user] file crontab [-u user] {-l | -r | -e}

# **Description**

**crontab** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

# **Optional Control Files**

The implementation shall support the XSI optional behavior for access control; however the files cron.allow and cron.deny may reside in /etc rather than /usr/lib/cron.

df

### **Name**

df — report file system disk space usage

# **Description**

The **df** command shall behave as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Differences**

#### **Options**

If the -k option is not specified, disk space is shown in unspecified units. If the -P option is specified, the size of the unit shall be printed on the header line in the format "%4s-blocks". Applications should specify -k.

The XSI option - t has unspecified behavior. Applications should not specify - t.

**Rationale:** The most common implementation of **df** uses the -t option for a different purpose (restricting output to a particular file system type), and use of -t is therefore non-portable.

#### **Operand May Identify Special File**

If an argument is the absolute file name of a special file containing a mounted file system, **df** shall show the space available on that file system rather than on the file system containing the special file (which is typically the root file system).

**Note:** In <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> the XSI optional behavior permits an operand to name a special file, but appears to require the operation be performed on the file system containing the special file. A defect report has been submitted for this case.

## dmesg

### **Name**

dmesg — print or control the system message buffer

## **Synopsis**

dmesg [-c | -n level | -s bufsize]

# **Description**

**dmesg** examines or controls the system message buffer. Only a user with appropriate privileges may modify the system message buffer parameters or contents.

# **Standard Options**

- C

If the user has appropriate privilege, clears the system message buffer contents after printing.

-n level

If the user has appropriate privilege, sets the level at which logging of messages is done to the console.

-s bufsize

uses a buffer of *bufsize* to query the system message buffer. This is 16392 by default.

### du

### Name

du — estimate file space usage

# **Description**

**du** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Differences**

If the -k option is not specified, disk space is shown in unspecified units. Applications should specify -k.

### echo

### **Name**

echo — write arguments to standard output

## **Synopsis**

echo [string...]

# **Description**

The **echo** command is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with the following differences.

Implementations may support implementation-defined options to **echo**. The behavior of **echo** if any arguments contain backslashes is also implementation defined.

# **Application Usage**

Conforming applications should not run **echo** with a first argument starting with a hyphen, or with any arguments containing backslashes; they should use **printf** in those cases.

**Note:** The behavior specified here is similar to that specified by <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009) without the XSI option. However, the LSB strongly recommends conforming applications not use any options (even if the implementation provides them) while <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009) specifies behavior if the first operand is the string -n.

### egrep

### **Name**

egrep — search a file with an Extended Regular Expression pattern

# **Description**

**egrep** is equivalent to **grep** -E. For further details, see the specification for **grep**.

# fgrep

### **Name**

fgrep — search a file with a fixed pattern

# **Description**

**fgrep** is equivalent to grep -F. For further details, see the specification for **grep**.

### file

### Name

file — determine file type

# **Description**

**file** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Differences**

The -M, -h, -d, and -i options need not be supported.

### fuser

### Name

fuser — identify processes using files or sockets

# **Description**

**fuser** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Differences**

The **fuser** command is a system administration utility, see <u>Path For System Administration Utilities</u>.

### **Option Differences**

-c has unspecified behavior.

-f

has unspecified behavior.

### gettext

### **Name**

gettext — retrieve text string from message catalog

## **Synopsis**

gettext [options] [textdomain] msgid gettext -s [options] msgid...

# **Description**

The **gettext** utility retrieves a translated text string corresponding to string *msgid* from a message object generated with **msgfmt** utility.

The message object name is derived from the optional argument *textdomain* if present, otherwise from the TEXTDOMAIN environment variable. If no domain is specified, or if a corresponding string cannot be found, **gettext** prints *msgid*.

Ordinarily **gettext** looks for its message object in *dirname/lang/LC\_MESSAGES* where *dirname* is the implementation-defined default directory and *lang* is the locale name. If present, the TEXTDOMAINDIR environment variable replaces the *dirname*.

This utility interprets C escape sequences such as \t for tab. Use \\ to print a backslash. To produce a message on a line of its own, either put a \n at the end of msgid, or use this command in conjunction with the **printf** utility.

When used with the -s option the **gettext** utility behaves like the **echo** utility, except that the message corresponding to *msgid* in the selected catalog provides the arguments.

# **Options**

- -d domainname
- --domain=domainname

PARAMETER translated messages from domainname.

-*е* 

Enable expansion of some escape sequences.

-*n* 

Suppress trailing newline.

# **Operands**

The following operands are supported:

textdomain

A domain name used to retrieve the messages.

msgid

A key to retrieve the localized message.

### **Environment Variables**

LANGUAGE

Specifies one or more locale names.

LANG

Specifies locale name.

### LC\_MESSAGES

Specifies messaging locale, and if present overrides LANG for messages.

#### **TEXTDOMAIN**

Specifies the text domain name, which is identical to the message object filename without .mo suffix.

### **TEXTDOMAINDIR**

Specifies the pathname to the message catalog, and if present replaces the implementation-defined default directory.

### **Exit Status**

The following exit values are returned:

0

Successful completion.

>0

An error occurred.

### grep

### Name

grep — print lines matching a pattern

# **Description**

**grep** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **LSB Differences**

Certain aspects of regular expression matching are optional; see Regular Expressions.

## groupadd

### **Name**

groupadd — create a new group

## **Synopsis**

groupadd [-g gid [-o]] group

# **Description**

If the caller has appropriate privilege, the **groupadd** command shall create a new group named *group*. The group name shall be unique in the group database. If no *gid* is specified, **groupadd** shall create the new group with a unique group ID. If the group named *group* already exists, or if a group with *gid* ID exists and *-o* option is not set, **groupadd** shall issue a diagnostic message and exit with a non-zero exit status.

The **groupadd** command is a system administration utility, see <u>Path For System</u> Administration Utilities.

# **Options**

-g gid [-o]

The new group shall have group ID *gid*. If the -o option is not used, no other group shall have this group ID. The value of *gid* shall be non-negative.

## groupdel

### Name

groupdel — delete a group

# **Synopsis**

groupdel group

# **Description**

If the caller has sufficient privilege, the **groupdel** command shall modify the system group database, deleting the group named *group*. If the group named *group* does not exist or is a primary group for existing user, **groupdel** shall issue a diagnostic message and exit with a non-zero exit status.

The **groupdel** command is a system administration utility, see <u>Path For System Administration Utilities</u>.

### groupmod

### **Name**

groupmod — modify a group

## **Synopsis**

groupmod [-g gid [-o]] [-n group\_name] group

# **Description**

If the caller has appropriate privilege, the **groupmod** command shall modify the entry in the system group database corresponding to a group named *group*.

The **groupmod** command is a system administration utility, see <u>Path For System Administration Utilities</u>.

# **Options**

-g gid [-o]

Modify the group's group ID, setting it to *gid*. If the -*o* option is not used, no other group shall have this group ID. The value of *gid*shall be non-negative.

**Note:** Only the group ID in the database is altered; any files with group ownership set to the original group ID are unchanged by this modification.

-n group\_name

changes the name of the group from group to group\_name.

### groups

### **Name**

groups — display a group

# **Synopsis**

groups [user]

# **Description**

The **groups** command shall behave as **id** -Gn [user], as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). The optional user parameter will display the groups for the named user.

# gunzip

### **Name**

gunzip — uncompress files

# **Description**

gunzip is equivalent to gzip -d. See the specification for gzip for further details.

<u>Filesystem Hierarchy Standard</u> requires that if **gunzip** exists, it must be a symbolic or hard link to /bin/gzip. This specification additionally allows **gunzip** to be a wrapper script which calls **gzip -d**.

### gzip

#### **Name**

gzip — compress or expand files

### **Synopsis**

gzip [-cdfhlLnNrtvV19] [-S suffix] [name...]

# **Description**

The **gzip** command shall attempt to reduce the size of the named files. Whenever possible, each file is replaced by one with the extension .gz, while keeping the same ownership, modes, access and modification times. If no files are specified, or if a file name is -, the standard input is compressed to the standard output. **gzip** shall only attempt to compress regular files. In particular, it will ignore symbolic links.

When compressing, gzip uses the deflate algorithm specified in <u>RFC 1951: DEFLATE Compressed Data Format Specification</u> and stores the result in a file using the gzip file format specified in <u>RFC 1952: GZIP File Format Specification</u>.

# **Options**

-c, --stdout, --to-stdout

writes output on standard output, leaving the original files unchanged. If there are several input files, the output consists of a sequence of independently compressed members. To obtain better compression, concatenate all input files before compressing them.

-d, --decompress, --uncompress

the name operands are compressed files, and gzip shall decompress them.

#### -f, --force

forces compression or decompression even if the file has multiple links or the corresponding file already exists, or if the compressed data is read from or written to a terminal. If the input data is not in a format recognized by **gzip**, and if the option --stdout is also given, copy the input data without change to the standard ouput: let **gzip** behave as **cat**. If -f is not given, and when not running in the background, **gzip** prompts to verify whether an existing file should be overwritten.

#### -l, --list

lists the compressed size, uncompressed size, ratio and uncompressed name for each compressed file. For files that are not in **gzip** format, the uncompressed size shall be given as -1. If the --verbose or -v option is also specified, the crc and timestamp for the uncompressed file shall also be displayed.

For decompression, gzip shall support at least the following compression methods:

- deflate (RFC 1951: DEFLATE Compressed Data Format Specification)
- compress (POSIX 1003.1-2008 (ISO/IEC 9945-2009))

The crc shall be given as ffffffff for a file not in gzip format.

If the --name or -N option is also specified, the uncompressed name, date and time are those stored within the compressed file, if present.

If the --quiet or -q option is also specified, the title and totals lines are not displayed.

#### -L, --license

displays the gzip license and quit.

#### -n. --no-name

does not save the original file name and time stamp by default when compressing. (The original name is always saved if the name had to be truncated.) When decompressing, do not restore the original file name if present (remove only the gzip suffix from the compressed file name) and do not restore the original time stamp if present (copy it from the compressed file). This option is the default when decompressing.

#### -N, --name

always saves the original file name and time stamp when compressing; this is the default. When decompressing, restore the original file name and time stamp if present. This option is useful on systems which have a limit on file name length or when the time stamp has been lost after a file transfer.

#### -q, --quiet

suppresses all warnings.

#### -r, --recursive

travels the directory structure recursively. If any of the file names specified on the command line are directories, **gzip** will descend into the directory and compress all the files it finds there (or decompress them in the case of **gunzip**).

#### -S .suf, --sufix .suf

uses suffix . suf instead of .gz.

#### -t. --test

checks the compressed file integrity.

#### -v, --verbose

displays the name and percentage reduction for each file compressed or decompressed.

#### -#, --fast, --best

regulates the speed of compression using the specified digit #, where -1 or --fast indicates the fastest compression method (less compression) and -9 or --best indicates the slowest compression method (best compression). The default compression level is -6 (that is, biased towards high compression at expense of speed).

# **LSB Deprecated Options**

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

#### -V, --version

displays the version number and compilation options, then quits.

### hostname

### Name

hostname — show or set the system's host name

# **Synopsis**

hostname [name]

# **Description**

**hostname** is used to either display or, with appropriate privileges, set the current host name of the system. The host name is used by many applications to identify the machine.

When called without any arguments, the program displays the name of the system as returned by the gethostname() function.

When called with a *name* argument, and the user has appropriate privilege, the command sets the host name.

**Note:** It is not specified if the hostname displayed will be a fully qualified domain name. Applications requiring a particular format of hostname should check the output and take appropriate action.

#### install

#### **Name**

install — copy files and set attributes

# **Synopsis**

install [option...] SOURCE DEST install [option...] SOURCE... DEST install
[-d | --directory] [option...] DIRECTORY...

# **Description**

In the first two formats, copy SOURCE to DEST or multiple SOURCE(s) to the existing DEST directory, optionally setting permission modes and file ownership. In the third format, each DIRECTORY and any missing parent directories shall be created.

# **Standard Options**

```
--backup[=METHOD]
```

makes a backup of each existing destination file. METHOD may be one of the following:

none or off

never make backups.

numbered or t

make numbered backups. A numbered backup has the form "%s.~%d~", target\_name, version\_number. Each backup shall increment the version number by 1.

existing or nil

behave as numbered if numbered backups exist, or simple otherwise.

simple or never

append a suffix to the name. The default suffix is '~', but can be overriden by setting SIMPLE\_BACKUP\_SUFFIX in the environment, or via the -S or --suffix option.

If no *METHOD* is specified, the environment variable VERSION\_CONTROL shall be examined for one of the above. Unambiguous abbreviations of *METHOD* shall be accepted. If no *METHOD* is specified, or if *METHOD* is empty, the backup method shall default to existing.

If METHOD is invalid or ambiguous, **install** shall fail and issue a diagnostic message.

-b

is equivalent to --backup=existing.

-d, --directory

treats all arguments as directory names; creates all components of the specified directories.

-D

creates all leading components of DEST except the last, then copies SOURCE to DEST; useful in the 1st format.

#### -g GROUP, --group=GROUP

if the user has appropriate privilege, sets group ownership, instead of process' current group. *GROUP* is either a name in the user group database, or a positive integer, which shall be used as a group-id.

#### -m MODE, --mode=MODE

sets permission mode (specified as in **chmod**), instead of the default rwxr-xr-x.

#### -o OWNER, --owner=OWNER

if the user has appropriate privilege, sets ownership. *OWNER* is either a name in the user login database, or a positive integer, which shall be used as a user-id.

#### -p, --preserve-timestamps

copies the access and modification times of SOURCE files to corresponding destination files.

#### -s, --strip

strips symbol tables, only for 1st and 2nd formats.

#### -S SUFFIX, --suffix=SUFFIX

equivalent to --backup=existing, except if a simple suffix is required, use SUFFIX.

#### --verbose

prints the name of each directory as it is created.

#### -v, --verbose

print the name of each file before copying it to stdout.

### install\_initd

#### Name

install\_initd — activate an init script

# **Synopsis**

/usr/lib/lsb/install\_initd initd\_file

# **Description**

**install\_initd** shall activate a system initialization file that has been copied to an implementation defined location such that this file shall be run at the appropriate point during system initialization. The **install\_initd** command is typically called in the postinstall script of a package, after the script has been copied to /etc/init.d. See also Installation and Removal of Init Scripts.

### ipcrm

### Name

ipcrm — remove IPC Resources

# **Synopsis**

```
ipcrm [-q msgid | -Q msgkey | -s semid | -S semkey | -m shmid | -M
shmkey]...ipcrm [shm | msg | msg] id...
```

# **Description**

If any of the -q, -Q, -s, -S, -m, or -M arguments are given, the **ipcrm** shall behave as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

Otherwise, **ipcrm** shall remove the resource of the specified type identified by *id*.

### **Future Directions**

A future revision of this specification may deprecate the second synopsis form.

**Rationale:** In its first Linux implementation, **ipcrm** used the second syntax shown in the SYNOPSIS. Functionality present in other implementations of **ipcrm** has since been added, namely the ability to delete resources by key (not just identifier), and to respect the same command line syntax. The previous syntax is still supported for backwards compatibility only.

### ipcs

#### **Name**

ipcs — provide information on ipc facilities

# **Synopsis**

ipcs [-smq] [-tcp]

# **Description**

**ipcs** provides information on the ipc facilities for which the calling process has read access.

**Note:** Although this command has many similarities with the optional **ipcs** utility described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, it has substantial differences and is therefore described separately. The options specified here have similar meaning to those in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>; other options specified there have unspecified behavior on an LSB conforming implementation. See <u>Application Usage</u> below. The output format is not specified.

# **Resource display options**

```
-m
shared memory segments.
-q
message queues.
-s
semaphore arrays.
```

# **Output format options**

```
-t time.
-p pid.
-c creator.
```

# **Application Usage**

In some implementations of ipcs the -a option will print all information available. In other implementations the -a option will print all resource types. Therefore, applications shall not use the -a option.

Some implementations of **ipcs** provide more output formats than are specified here. These options are not consistent between differing implementations of **ipcs**. Therefore, only the -t, -c and -p option formatting flags may be used. At least one of the -t, -c and -p options and at least one of -m, -q and -s options shall be specified. If no options are specified, the output is unspecified.

#### killall

#### **Name**

killall — kill processes by name

# **Synopsis**

killall [-egiqvw] [-signal] name... killall -l killall -V

# **Description**

**killall** sends a signal to all processes running any of the specified commands. If no signal name is specified, SIGTERM is sent.

Signals can be specified either by name (e.g. -HUP) or by number (e.g. -1). Signal 0 (check if a process exists) can only be specified by number.

If the command name contains a slash (/), processes executing that particular file will be selected for killing, independent of their name.

**killall** returns a non-zero return code if no process has been killed for any of the listed commands. If at least one process has been killed for each command, **killall** returns zero

A killall process never kills itself (but may kill other killall processes).

# **Standard Options**

-е

requires an exact match for very long names. If a command name is longer than 15 characters, the full name may be unavailable (i.e. it is swapped out). In this case, **killall** will kill everything that matches within the first 15 characters. With -e, such entries are skipped. **killall** prints a message for each skipped entry if -v is specified in addition to -e.

-g

kills the process group to which the process belongs. The kill signal is only sent once per group, even if multiple processes belonging to the same process group were found.

-i

asks interactively for confirmation before killing.

-1

lists all known signal names.

-q

does not complain if no processes were killed.

-v

reports if the signal was successfully sent.

# **LSB Deprecated Options**

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

-V

displays version information.

### lpr

#### **Name**

1pr — off line print

# **Synopsis**

```
lpr [-1] [-p] [-Pprinter] [-h] [-s] [-#copies] [-J name] [-T title]
[name .....]
```

# **Description**

**lpr** uses a spooling daemon to print the named files when facilities become available. If no names appear, the standard input is assumed.

# **Standard Options**

-l identifies binary data that is not to be filtered but sent as raw input to printer.

-p formats with "pr" before sending to printer.

-Pprinter

sends output to the printer named printer instead of the default printer.

-h suppresses header page.

-s uses symbolic links.

-#copies

specifies copies as the number of copies to print.

-J name

specifies name as the job name for the header page.

-T title

specifies title as the title used for "pr".

Is

### Name

1s — list directory contents

# **Description**

**ls** shall behave as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with extensions listed below.

### **Extensions**

-1

If the file is a character special or block special file, the size of the file shall be replaced with two unsigned numbers in the format "%u, %u", representing the major and minor device numbers associated with the special file.

**Note:** The LSB does not specify the meaning of the major and minor devices numbers.

-p

in addition to <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> XSI optional behavior of printing a slash for a directory, **ls -p** may display other characters for other file types.

### lsb\_release

### Name

lsb\_release — print distribution specific information

# **Synopsis**

lsb\_release [option...]

# **Description**

The **lsb\_release** command prints certain LSB (Linux Standard Base) and Distribution information.

If no options are given, the -v option is the default.

# **Options**

#### -v, --version

displays the LSB version the distribution is compliant with. The version is expressed as a colon separated list of versioned LSB module identifiers. An LSB module identifier is a dash-separated tuple consisting of module name and version or module name, version and architecture name, in that order. The version output is presented as a single line of text beginning with LSB Version: followed by a tab character, then the list of LSB module identifiers. This format is intended to be easily parsable by programs which need to consume the data. Excepting core, which must always be present, the list of module identifiers may change over time depending on installations and removals of system software.

Example: LSB Version: core-5.0-amd64:core-5.0-noarch:desktop-5.0-amd64:desktop-5.0-noarch:languages-5.0:imaging-5.0

**Note:** An implementation may support multiple releases of the same module. To claim compliance, the implementation shall list all relevant module identifiers. Version specific library interfaces, if any, will be selected by the program interpreter, which may change from release to release. Version specific commands and utilities, if any, will be described in the relevant specification.

For reporting or querying compliance with this release of the specification, use the module names found in the *Package Dependencies* section of the *Package Format and Installation* chapter for that module specification.

#### -i, --id

displays a string identifying the distribution provider. The id output is a single line of text beginning with Distributor ID: followed by a tab character, then the id string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: Distributor ID: Frobnozz

#### -d, --description

displays text describing the distribution. The description output is a single line of text beginning with Description: followed by a tab character, then the description string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: Description: Frobnozz release 9 (Gilpher)

#### LSB Core - Generic 5.0

#### -r, --release

displays the release number of distribution. The release output is a single line of text beginning with Release: followed by a tab character, then the release string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: Release: 9

#### -c, --codename

displays a codename which corresponds to the distribution release. The codename output is a single line of text beginning with Codename: followed by a tab character, then the codename string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: Codename: Gilpher

-a, --all

displays all of the above information.

-s, --short

displays all of the above information in a short output format.

-h, --help

displays a human-readable help message.

#### m4

#### **Name**

m4 — macro processor

# **Description**

**m4** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with extensions as listed below.

### **Extensions**

-P

forces all builtins to be prefixed with m4. For example, define becomes m4\_define.

#### -I directory

Add directory to the end of the search path for includes.

### md5sum

### **Name**

md5sum — generate or check MD5 message digests

# **Synopsis**

md5sum [-c [file] | file]

# **Description**

For each file, write to standard output a line containing the MD5 message digest of that file, followed by one or more blank characters, followed by the name of the file. The MD5 message digest shall be calculated according to RFC 1321: The MD5 Message-Digest Algorithm and output as 32 hexadecimal digits.

If no file names are specified as operands, read from standard input and use "-" as the file name in the output.

# **Options**

-c [file]

checks the MD5 message digest of all files named in *file* against the message digest listed in the same file. The actual format of *file* is the same as the output of **md5sum**. That is, each line in the file describes a file. If *file* is not specified, read message digests from stdin.

### **Exit Status**

**md5sum** shall exit with status 0 if the sum was generated successfully, or, in check mode, if the check matched. Otherwise, **md5sum** shall exit with a non-zero status.

#### mknod

#### **Name**

mknod — make special files

### **Synopsis**

mknod [-m mode | --mode=mode] name type [major minor]mknod [--version]

# **Description**

The **mknod** command shall create a special file named *name* of the given *type*.

The *type* shall be one of the following:

b

creates a block (buffered) special file with the specified major and minor device numbers.

c, u

creates a character (unbuffered) special file with the specified major and minor device numbers.

p

creates a FIFO.

### **Options**

```
-m mode, --mode=mode
```

create the special file with file access permissions set as described in *mode*. The permissions may be any absolute value (i.e. one not containing '+' or '-') acceptable to the **chmod** command.

--version

output version information and exit.

**Note:** This option may be deprecated in a future release of this specification.

If *type* is p, *major* and *minor* shall not be specified. Otherwise, these parameters are mandatory.

### **Future Directions**

This command may be deprecated in a future version of this specification. The *major* and *minor* operands are insufficently portable to be specified usefully here. Only a FIFO can be portably created by this command, and the **mkfifo** command is a simpler interface for that purpose.

### mktemp

#### **Name**

mktemp — make temporary file name (unique)

# **Synopsis**

mktemp [-q] [-u] template

# **Description**

The **mktemp** command takes the given file name *template* and overwrites a portion of it to create a file name. This file name shall be unique and suitable for use by the application.

The *template* should have at least six trailing 'X' characters. These characters are replaced with characters from the portable filename character set in order to generate a unique name.

If **mktemp** can successfully generate a unique file name, and the -u option is not present, the file shall be created with read and write permission only for the current user. The **mktemp** command shall write the filename generated to the standard output.

# **Options**

-q

fail silently if an error occurs. Diagnostic messages to stderr are suppressed, but the command shall still exit with a non-zero exit status if an error occurs.

-u

operates in `unsafe' mode. A unique name is generated, but the temporary file shall be unlinked before **mktemp** exits. Use of this option is not encouraged.

#### more

### **Name**

more — display files on a page-by-page basis

### **Description**

more is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Differences**

The **more** command need not respect the LINES and COLUMNS environment variables.

The following additional options may be supported:

-num

specifies an integer which is the screen size (in lines).

+num

starts at line number num.

+/pattern

Start at the first line matching the pattern, equivalent to executing the search forward (/) command with the given pattern immediately after opening each file.

The following options from <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> may behave differently:

-e

has unspecified behavior.

-i

has unspecified behavior.

-n

has unspecified behavior.

-p

Either clear the whole screen before displaying any text (instead of the usual scrolling behavior), or provide the behavior specified by <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009). In the latter case, the syntax is "-p command".

-t

has unspecified behavior.

The more command need not support the following interactive commands:

```
g
G
u
control u
control f
newline
j
k
r
R
m
'(return to mark)
/!
?
N
:e
:t
control g
ZZ
```

### **Rationale**

The +num and +/string options are deprecated in <u>SUSv2</u>, and have been removed in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>; however this specification continues to specify them because the publicly available util-linux package does not support the replacement (-p command). The +command option as found in <u>SUSv2</u> is more general than is specified here, but the util-linux package appears to only support the more specific +num and +/string forms.

#### mount

#### **Name**

mount — mount a file system

# **Synopsis**

```
mount [-hV]mount [-a] [-fFnrsvw] [-t vfstype]mount [-fnrsvw] [-0 options
[,...]] [device | dir]mount [-fnrsvw] [-t vfstype] [-0 options] device dir
```

# **Description**

As described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, all files in the system are organized in a directed graph, known as the file hierarchy, rooted at /. These files can be spread out over several underlying devices. The **mount** command shall attach the file system found on some underlying device to the file hierarchy.

# **Options**

-v

invoke verbose mode. The **mount** command shall provide diagnostic messages on stdout.

-a

mount all file systems (of the given types) mentioned in /etc/fstab.

-F

If the -a option is also present, fork a new incarnation of **mount** for each device to be mounted. This will do the mounts on different devices or different NFS servers in parallel.

-f

cause everything to be done except for the actual system call; if it's not obvious, this `fakes' mounting the file system.

-n

mount without writing in /etc/mtab. This is necessary for example when /etc is on a read-only file system.

-S

ignore **mount** options not supported by a file system type. Not all file systems support this option.

-r

mount the file system read-only. A synonym is -o ro.

-w

mount the file system read/write. (default) A synonym is -o rw.

-L label

If the file /proc/partitions is supported, mount the partition that has the specified label.

-U uuid

If the file /proc/partitions is supported, mount the partition that has the specified uuid.

#### -t vfstype

indicate a file system type of vfstype.

More than one type may be specified in a comma separated list. The list of file system types can be prefixed with no to specify the file system types on which no action should be taken.

-о

options are specified with a -o flag followed by a comma-separated string of options. Some of these options are only useful when they appear in the /etc/fstab file. The following options apply to any file system that is being mounted:

async

perform all I/O to the file system asynchronously.

atime

update inode access time for each access. (default)

auto

in /etc/fstab, indicate the device is mountable with -a.

defaults

use default options: rw, suid, dev, exec, auto, nouser, async.

dev

interpret character or block special devices on the file system.

exec

permit execution of binaries.

noatime

do not update file access times on this file system.

noauto

in /etc/fstab, indicates the device is only explicitly mountable.

nodev

do not interpret character or block special devices on the file system.

noexec

do not allow execution of any binaries on the mounted file system.

nosuid

do not allow set-user-identifier or set-group-identifier bits to take effect.

nouser

forbid an unprivileged user to mount the file system. (default)

remount

#### LSB Core - Generic 5.0

remount an already-mounted file system. This is commonly used to change the mount options for a file system, especially to make a read-only file system writable.

ro

mount the file system read-only.

rw

mount the file system read-write.

suid

allow set-user-identifier or set-group-identifier bits to take effect.

sync

do all I/O to the file system synchronously.

user

allow an unprivilieged user to mount the file system. This option implies the options noexec, nosuid, nodev unless overridden by subsequent options.

# **LSB Deprecated Options**

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

-V

output version and exit.

### msgfmt

#### **Name**

msgfmt — create a message object from a message file

### **Synopsis**

```
msgfmt [options...] filename...
```

# **Description**

The **msgfmt** command generates a binary message catalog from a textual translation description. Message catalogs, or message object files, are stored in files with a .mo extension.

**Note:** The format of message object files is not guaranteed to be portable. Message catalogs should always be generated on the target architecture using the **msgfmt** command.

The source message files, otherwise known as portable object files, have a .po extension.

The *filename* operands shall be portable object files. The .po file contains messages to be displayed to users by system utilities or by application programs. The portable object files are text files, and the messages in them can be rewritten in any language supported by the system.

If any filename is -, a portable object file shall be read from the standard input.

The **msgfmt** command interprets data as characters according to the current setting of the LC\_CTYPE locale category.

# **Options**

```
-c
--check
```

Detect and diagnose input file anomalies which might represent translation errors. The msgid and msgstr strings are studied and compared. It is considered abnormal that one string starts or ends with a newline while the other does not.

If the message is flagged as c-format (see <u>Comment Handling</u>), check that the msgid string and the msgstr translation have the same number of % format specifiers, with matching types.

```
-D directory
--directory=directory
```

Add directory to list for input files search. If *filename* is not an absolute pathname and *filename* cannot be opened, search for it in *directory*. This option may be repeated. Directories shall be searched in order, with the leftmost *directory* searched first.

```
-f
--use-fuzzy
```

Use entries marked as fuzzy in output. If this option is not specified, such entries are not included into the output. See <u>Comment Handling</u> below.

```
-o output-file
--output-file=output-file
```

#### LSB Core - Generic 5.0

Specify the output file name as output-file. If multiple domains or duplicate msgids in the .po file are present, the behavior is unspecified. If output-file is -, output is written to standard output.

#### --strict

Ensure that all output files have a .mo extension. Output files are named either by the -o (or --output-file) option, or by domains found in the input files.

-v --verbose

Print additional information to the standard error, including the number of translated strings processed.

### **Operands**

The *filename* operands are treated as portable object files. The format of portable object files is defined in EXTENDED DESCRIPTION.

# **Standard Input**

The standard input is not used unless a filename operand is specified as "-".

### **Environment Variables**

#### LANGUAGE

Specifies one or more locale names.

#### LANG

Specifies locale name.

#### LC\_ALL

Specifies locale name for all categories. If defined, overrides LANG, LC\_CTYPE and LC\_MESSAGES.

#### LC\_CTYPE

Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).

#### LC\_MESSAGES

Specifies messaging locale, and if present overrides LANG for messages.

# **Standard Output**

The standard output is not used unless the option-argument of the -o option is specified as -.

# **Extended Description**

The format of portable object files (.po files) is defined as follows. Each .po file contains one or more lines, with each line containing either a comment or a statement. Comments start the line with a hash mark (#) and end with the newline character. Empty lines, or lines containing only white-space, shall be ignored. Comments can in certain circumstances alter the behavior of **msgfmt**. See <u>Comment Handling</u> below for details on comment processing. The format of a statement is:

directive value

Each directive starts at the beginning of the line and is separated from value by white space (such as one or more space or tab characters). The value consists of one or more quoted strings separated by white space. If two or more strings are specified as value, they are normalized into single string using the string normalization syntax specified in <u>ISO C (1999)</u>. The following directives are supported:

```
domain domainname
msgid message_identifier
msgid_plural untranslated_string_plural
msgstr message_string
msgstr[n] message_string
```

The behavior of the domain directive is affected by the options used. See OPTIONS for the behavior when the -o option is specified. If the -o option is not specified, the behavior of the domain directive is as follows:

- 1. All msgids from the beginning of each .po file to the first domain directive are put into a default message object file, messages (or messages.mo if the --strict option is specified).
- 2. When **msgfmt** encounters a domain domainname directive in the .po file, all following *msgids* until the next domain directive are put into the message object file domainname (or domainname .mo if --strict option is specified).
- 3. Duplicate *msgids* are defined in the scope of each domain. That is, a *msgid* is considered a duplicate only if the identical *msgid* exists in the same domain.
- 4. All duplicate *msgids* are ignored.

The msgid directive specifies the value of a message identifier associated with the directive that follows it. The msgid\_plural directive specifies the plural form message specified to the plural message handling functions ngettext(), dngettext() or dcngettext(). The message\_identifier string identifies a target string to be used at retrieval time. Each statement containing a msgid directive shall be followed by a statement containing a msgstr directive or msgstr[n] directives.

The msgstr directive specifies the target string associated with the message\_identifier string declared in the immediately preceding msgid directive.

The msgstr[n] (where n = 0, 1, 2, ...) directive specifies the target string to be used with plural form handling functions ngettext(), dngettext() and dcngettext().

Message strings can contain the following escape sequences:

#### **Table 17-1 Escape Sequences**

### LSB Core - Generic 5.0

\n	newline
\t	tab
\v	vertical tab
\b	backspace
\r	carriage return
\f	formfeed
\\	backslash
\"	double quote
\ddd	octal bit pattern

\xHH	hexadecimal bit pattern
(21111	Hexadecillar bit pattern

### **Comment Handling**

Comments are introduced by a #, and continue to the end of the line. The second character (i.e. the character following the #) has special meaning. Regular comments should follow a space character. Other comment types include:

```
# normal-comments
```

#. automatic-comments

#: reference...

#, flag

Automatic and reference comments are typically generated by external utilities, and are not specified by the LSB. The **msgfmt** command shall ignore such comments.

**Note:** Portable object files may be produced by unspecified tools. Some of the comment types described here may arise from the use of such tools. It is beyond the scope of this specification to describe these tools.

The #, comments require one or more flags separated by the comma (,) character. The following flags can be specified:

fuzzy

This flag shows that the following msgstr string might not be a correct translation. Only the translator (i.e. the individual undertaking the translation) can judge if the translation requires further modification, or is acceptable as is. Once satisfied with the translation, the translator then removes this fuzzy flag.

If this flag is specified, the **msgfmt** utility will not generate the entry for the immediately following msgid in the output message catalog, unless the --use-fuzzy is specified.

c-format no-c-format

The c-format flag indicates that the msgid string is used as format string by printf()-like functions. If the c-format flag is given for a string the **msgfmt** utility may perform additional tests to check the validity of the translation.

### **Plurals**

The msgid entry with empty string ("") is called the header entry and is treated specially. If the message string for the header entry contains nplurals=value, the value indicates the number of plural forms. For example, if nplurals=4, there are 4 plural forms. If nplurals is defined, there should be a plural=expression on the same line, separated by a semicolon (;) character. The expression is a C language expression to determine which version of msgstr[n] to be used based on the value of n, the last argument of ngettext(), dngettext() or dcngettext(). For example:

```
nplurals=2; plural=n == 1 ? 0 : 1
```

indicates that there are 2 plural forms in the language; msgstr[0] is used if n == 1, otherwise msgstr[1] is used. Another example:

```
nplurals=3; plural=n==1 ? 0 : n==2 ? 1 : 2
```

indicates that there are 3 plural forms in the language; msgstr[0] is used if n == 1, msgstr[1] is used if n == 2, otherwise msgstr[2] is used.

If the header entry contains charset=codeset string, the codeset is used to indicate the codeset to be used to encode the message strings. If the output string's codeset is different from the message string's codeset, codeset conversion from the message strings's codeset to the output string's codeset will be performed upon the call of gettext(), dgettext(), dgettext(), ngettext(), dngettext(), and dcngettext(). The output string's codeset is determined by the current locale's codeset (the return value of nl\_langinfo(CODESET)) by default, and can be changed by the call of bind\_textdo-main\_codeset().

### **Exit Status**

The following exit values are returned:

0

Successful completion.

>0

An error occurred.

# **Application Usage**

Neither **msgfmt** nor any gettext() function imposes a limit on the total length of a message. Installing message catalogs under the C locale is pointless, since they are ignored for the sake of efficiency.

# **Examples**

Example 1: Examples of creating message objects from message files.

In this example module1.po, module2.po and module3.po are portable message object files.

```
example% cat module1.po

# default domain "messages"
msgid "message one"
msgstr "mensaje número uno"

#
domain "help_domain"
msgid "help two"
msgstr "ayuda número dos"

#
domain "error_domain"
msgid "error three"
msgstr "error número tres"
example% cat module2.po

# default domain "messages"
msgid "message four"
```

```
msgstr "mensaje número cuatro"
domain "error_domain"
msgid "error five"
msgstr "error número cinco"
domain "window_domain"
msgid "window six"
msgstr "ventana número seises"
example% cat module3.po
# default domain "messages"
msgid "message seven"
msgstr "mensaje número siete"
The following command will produce the output files messages, help_domain, and
error_domain.
example% msgfmt module1.po
The following command will produce the output files messages.mo, help_do-
main.mo, error_domain.mo, and window_domain.mo.
example% msgfmt module1.po module2.po
The following example will produce the output file hello.mo.
example% msgfmt -o hello.mo module3.po
```

### newgrp

### **Name**

newgrp — change group ID

# **Synopsis**

newgrp [group]

# **Description**

The **newgrp** command is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

#### **Differences**

The -1 option specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> need not be supported.

od

#### **Name**

od — dump files in octal and other formats

# **Synopsis**

```
od [-abcdfilox] [-w width | --width-width] [-v] [-A address_base] [-j skip]
[-n count] [-t type_string] [file...]od --traditional [options] [file]
[[+]offset [.] [b]] [[+]label [.] [b]]
```

### **Description**

The **od** command shall provide all of the madatory functionality specified in <u>POSIX</u> 1003.1-2008 (ISO/IEC 9945-2009), but with extensions and differences to the XSI optional behavior as listed below.

### **Extensions and Differences**

unspecified behavior.

**Note:** Applications wishing to achieve the <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> behavior for -s should instead use -t d2.

-wwidth, --width[=width]

each output line is limited to width bytes from the input.

--traditional

accepts arguments in traditional form, see Traditional Usage below.

**Note:** The XSI optional behavior for offset handling described in <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009) is not supported unless the *--traditional* option is also specified.

### Pre-POSIX and XSI Specifications

The LSB supports mixing options between the mandatory and XSI optional synopsis forms in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. The LSB shall support the following options:

```
is equivalent to -t a, selects named characters.
is equivalent to -t o1, selects octal bytes.
c is equivalent to -t c, selects characters.
d is equivalent to -t u2, selects unsigned decimal two byte units.
-f
```

is equivalent to -t fF, selects floats.

-i

is equivalent to -t d2, selects decimal two byte units.

**Note:** This usage may change in future releases; portable applications should use -t d2.

-1

is equivalent to -t d4, selects decimal longs.

**-**O

is equivalent to -t o2, selects octal two byte units.

-X

is equivalent to -t x2, selects hexadecimal two byte units.

Note that the XSI option -s need not be supported.

### **Traditional Usage**

If the *--traditional* option is specified, there may be between zero and three operands specified.

If no operands are specified, then **od** shall read the standard input.

If there is exactly one operand, and it is an offset of the form [+]offset[.][b], then it shall be interpreted as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. The file to be dumped shall be the standard input.

If there are exactly two operands, and they are both of the form [+]offset[.][b], then the first shall be treated as an offset (as above), and the second shall be a label, in the same format as the offset. If a label is specified, then the first output line produced for each input block shall be preceded by the input offset, cumulative across input files, of the next byte to be written, followed by the label, in parentheses. The label shall increment in the same manner as the offset.

If there are three operands, then the first shall be the file to dump, the second the offset, and the third the label.

**Note:** Recent versions of **coreutils** contain an **od** utility that conforms to <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. However, in April 2005, this version was not in widespread use. A future version of this specification may remove the differences.

### passwd

### **Name**

passwd — change user password

### **Synopsis**

passwd [-x max] [-n min] [-w warn] [-i inact] name passwd {-l | -u} name

# **Description**

**passwd** changes authentication information for user and group accounts, including passwords and password expiry details, and may be used to enable and disable accounts. Only a user with appropriate privilege may change the password for other users or modify the expiry information.

# **Options**

-x max

sets the maximum number of days a password remains valid.

-n min

sets the minimum number of days before a password may be changed.

-w warn

sets the number of days warning the user will receive before their password will expire.

-i inactive

disables an account after the password has been expired for the given number of days.

-1

disables an account by changing the password to a value which matches no possible encrypted value.

-u

re-enables an account by changing the password back to its previous value.

### patch

### **Name**

patch — apply a diff file to an original

# **Description**

**patch** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with extensions as listed below.

### **Extensions**

--binary

reads and write all files in binary mode, except for standard output and /dev/tty. This option has no effect on POSIX-compliant systems.

-u, --unified

interprets the patch file as a unified context diff.

### pidof

#### **Name**

pidof — find the process ID of a running program

# **Synopsis**

pidof [-s] [-x] [-o omitpid...] program...

# **Description**

Return the process ID of a process which is running the program named on the command line.

The **pidof** command is a system administration utility, see <u>Path For System Administration Utilities</u>.

# **Options**

- -s instructs the program to only return one pid.
- -x causes the program to also return process id's of shells running the named scripts.
- -o omits processes with specified process id.

### remove\_initd

### **Name**

remove\_initd — clean up init script system modifications introduced by install\_initd

# **Synopsis**

/usr/lib/lsb/remove\_initd initd\_file

### Description

**remove\_initd** processes the removal of the modifications made to a distribution's init script system by the **install\_initd** program. This cleanup is performed in the preuninstall script of a package; however, the package manager is still responsible for removing the script from the repository. See also <u>Installation and Removal of Init Scripts</u>.

#### renice

### **Name**

renice — alter priority of running processes

# **Description**

**renice** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Differences**

-n increment

has unspecified behavior.

#### sed

#### **Name**

sed — stream editor

# **Description**

**sed** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **LSB Differences**

Certain aspects of internationalized regular expressions are optional; see <u>Regular Expressions</u>.

#### sendmail

#### **Name**

sendmail — an electronic mail transport agent

### **Synopsis**

/usr/sbin/sendmail [options] [address...]

# **Description**

To deliver electronic mail (email), implementations shall provide the interface described here as a command named **sendmail**. This interface shall be the default delivery method for applications needing to transmit an email message.

This program sends an email message to one or more recipients, routing the message as necessary. This program is not intended as a user interface routine.

With no options, **sendmail** reads its standard input up to an end-of-file or a line consisting only of a single dot and sends a copy of the message found there to all of the addresses listed. It determines the network(s) to use based on the syntax and contents of the addresses.

If an address is preceded by a backslash, '\', it is unspecified whether the address is subject to local alias expansion.

The format of messages shall be as defined in RFC 2822:Internet Message Format.

**Note:** The required name **sendmail** was chosen for historical reasons, but the behaviors specified here are intended to reflect functionality which can be provided by a number of other implementations such as **smail**, **exim** and others. This specification does not require that the specific **sendmail** program be the implementation chosen to provide this functionality.

# **Options**

-bm

read mail from standard input and deliver it to the recipient addresses. This is the default mode of operation.

-bp

If the user has sufficient privilege, list information about messages currently in the mail queue.

-bs

use the SMTP protocol as described in <u>RFC 2821:Simple Mail Transfer Protocol</u>; read SMTP commands on standard input and write SMTP responses on standard output.

In this mode, **sendmail** shall accept \r\n (CR-LF), as required by <u>RFC 2821:Simple Mail Transfer Protocol</u>, and \n (LF) line terminators.

#### -F fullname

explicitly set the full name of the sender for incoming mail unless the message already contains a From: message header.

If the user running **sendmail** is not sufficiently trusted, then the actual sender may be indicated in the message, depending on the configuration of the agent.

-f name

#### LSB Core - Generic 5.0

explicitly set the envelope sender address for incoming mail. If there is no From: header, the address specified in the From: header will also be set.

If the user running **sendmail** is not sufficiently trusted, then the actual sender shall be indicated in the message.

-i

ignore dots alone on lines by themselves in incoming messages. If this options is not specified, a line consisting of a single dot shall terminate the input. If -bs is also used, the behavior is unspecified.

-odb

deliver any mail in background, if supported; otherwise ignored.

-odf

deliver any mail in foreground, if supported; otherwise ignored.

-oem or -em

mail errors back to the sender. (default)

-oep or -ep

write errors to the standard error output.

-oeq or -eq

do not send notification of errors to the sender. This only works for mail delivered locally.

-oi

is equivalent to -i.

-om

indicate that the sender of a message should receive a copy of the message if the sender appears in an alias expansion. Ignored if aliases are not supported.

-t

read the message to obtain recipients from the To:, Cc:, and Bcc: headers in the message instead of from the command arguments. If a Bcc: header is present, it is removed from the message unless there is no To: or Cc: header, in which case a Bcc: header with no data is created, in accordance with <a href="RFC 2822:Internet Message Format">RFC 2822:Internet Message Format</a>.

If there are any operands, the recipients list is unspecified.

This option may be ignored when not in -bm mode (the default).

**Note:** It is recommended that applications use as few options as necessary, none if possible.

### **Exit status**

The **sendmail** command returns an exit status indicating the results of the operation. The exit codes are as defined in <sysexits.h>.

EX\_OK

successful completion on all addresses. Note this does not necessarily indicate successful delivery.

EX\_NOUSER

The user specified did not exist.

#### EX\_UNAVAILABLE

A required service or resource was unavailable.

#### EX USAGE

Command was invoked incorrectly, such as wrong number of arguments, syntax error in arguments, bad flags.

#### EX\_SOFTWARE

An internal sofware error was detected. Includes bad arguments.

#### EX\_OSERROR

An operating system error was detected. Includes failure to execute fork() or pipe().

### EX\_NOHOST

The host specified did not exist.

#### EX\_TEMPFAIL

Temporary failure. Used to indicate the message could not be sent immediately, perhaps because a connection could not be created, but the request can be retried.

#### seq

#### **Name**

seq — generate a sequence of numbers

### **Synopsis**

/usr/bin/seq [-f fmt\_str] [-s sep\_str] [first\_num] [inc\_num] last\_num

# **Description**

The **seq** command shall output a sequence of numbers from <code>first\_num</code> to <code>last\_num</code>, stepping by the increment <code>inc\_num</code>. The <code>first\_num</code> and <code>last\_num</code> parameters may be omitted, and default to 1 even when <code>first\_num</code> is greater than <code>last\_num</code>. Floating-point values may be specified for <code>first\_num</code>, <code>inc\_num</code>, and <code>last\_num</code>.

The  $fmt\_str$  parameter is a floating point format string like the one used for the printf() function in C.

The  $sep\_str$  parameter string separates the values that are output. The default is a newline character (/n).

**Note:** If first\_num is less than last\_num and inc\_num is negative, or first\_num is greater than last\_num and inc\_num is positive, seq shall not generate any output.

# **Standard Options**

-f fmt\_str

Format the numbers in the output sequence according to *fmt\_str*, a floating point format string like the one used for the printf() function in C.

-s sep\_str

Separate the numbers in the output sequence with  $sep\_str$ . The default separator string is a newline character ( $\n$ ).

first\_num

The first number in the output sequence. Defaults to 1. May be a floating point value.

inc num

The increment for the output sequence. Defaults to 1. May be a floating point value.

last\_num

The last number in the output sequence. May be a floating point value.

sh

### **Name**

sh — shell, the standard command language interpreter

# **Description**

The **sh** utility shall behave as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with extensions listed below.

### **Shell Invocation**

The shell shall support an additional option, -1 (the letter *ell*). If the -1 option is specified, or if the first character of argument zero (the command name) is a '-', this invokation of the shell is a *login shell*.

An interactive shell, as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, that is also a login shell, or any shell if invoked with the -1 option, shall, prior to reading from the input file, first read and execute commands from the file /etc/profile, if that file exists, and then from a file called ~/.profile, if such a file exists.

**Note:** This specification requires that the **sh** utility shall also read and execute commands in its current execution environment from all the shell scripts in the directory /etc/profile.d. Such scripts are read and executed as a part of reading and executing /etc/profile.

#### shutdown

### **Name**

shutdown — shut the system down

# **Synopsis**

```
/sbin/shutdown [-t sec] [-h | -r] [-akfF] time [warning-
message]/sbin/shutdown -c [warning-message]
```

# **Description**

The **shutdown** command shall shut the system down in a secure way (first synopsis), or cancel a pending shutdown (second synopsis). When the shutdown is initiated, all logged-in users shall be notified immediately that the system is going down, and users shall be prevented from logging in to the system. The *time* specifies when the actual shutdown shall commence. See below for details. At the specified time all processes are first notified that the system is going down by the signal SIGTERM. After an interval (see *-t*) all processes shall be sent the signal SIGKILL. If neither the *-h* or the *-r* argument is specified, then the default behavior shall be to take the system to a runlevel where administrative tasks can be run. See also Run Levels.

Note: This is sometimes referred to as "single user mode".

The -h and -r options are mutually exclusive. If either the -h or -r options are specified, the system shall be halted or rebooted respectively.

# **Standard Options**

```
use access control. See below.

-t sec

tell the system to wait sec seconds between sending processes the warning and the kill signal, before changing to another runlevel. The default period is unspecified.

-k

do not really shutdown; only send the warning messages to everybody.

-r

reboot after shutdown.

-h

halt after shutdown. Actions after halting are unspecified (e.g. power off).

-f

advise the system to skip file system consistency checks on reboot.

-F

advise the system to force file system consistency checks on reboot.
```

time

-c

cancel an already running shutdown.

specify when to shut down.

The time argument shall have the following format: [now | [+]mins | hh:mm] If the format is hh:mm, hh shall specify the hour (1 or 2 digits) and mm is the minute of the hour (exactly two digits), and the shutdown shall commence at the next occurence of the specified time. If the format is mins (or +mins), where mins is a decimal number, shutdown shall commence in the specified number of minutes. The word now is an alias for +0.

warning-message

specify a message to send to all users.

#### **Access Control**

If the **shutdown** utility is invoked with the -a option, it shall check that an authorized user is currently logged in on the system console. Authorized users are listed, one per line, in the file /etc/shutdown.allow. Lines in this file that begin with a '#' or are blank shall be ignored.

**Note:** The intent of this scheme is to allow a keyboard sequence entered on the system console (e.g. CTRL-ALT-DEL, or STOP-A) to automatically invoke **shutdown -a**, and can be used to prevent unauthorized users from shutting the system down in this fashion.

su

### Name

su - change user ID

# **Synopsis**

su [options] [-] [username [ARGS]]

# **Description**

The **su** command shall start a shell running with the real and effective user and group IDs of the user *username*. If *username* is not specified, **su** shall default to an unspecified user with all appropriate privileges. If the -s or --shell is not specified, the shell to be invoked shall be that specified for *username* in the user database (see getp-wnam()), or /bin/sh if there is no shell specified in the user database.

If the - option is specified, or if the first operand is -, the environment for the shell shall be initialized as if the new shell was a login shell (see <u>Shell Invocation</u>).

If the invoking user does not have appropriate privileges, the **su** command shall prompt for a password and validate this before continuing. Invalid passwords shall produce an error message. The **su** command shall log in an unspecified manner all invokations, whether successful or unsuccessful.

Any operands specified after the *username* shall be passed to the invoked shell.

If the option - is not specified, and if the first operand is not -, the environment for the new shell shall be intialized from the current environment. If none of the -m, -p, or --preserve-environment options are specified, the environment may be modified in unspecified ways before invoking the shell. If any of the -m, -p, or --preserve-environment options are specified, the environment shall not be altered.

**Note:** Although the **su** command shall not alter the environment, the invoked shell may still alter it before it is ready to intepret any commands.

# **Standard Options**

-

the invoked shell shall be a login shell.

-c command, --command=command

Invoke the shell with the option -c command.

-m, -p, --preserve-environment

The current environment shall be passed to the invoked shell. If the environment variable SHELL is set, it shall specify the shell to invoke, if it matches an entry in /etc/shells. If there is no matching entry in /etc/shells, this option shall be ignored if the - option is also specified, or if the first operand is -.

-s shell, --shell=shell

Invoke *shell* as the comamnd interpreter. The shell specified shall be present in /etc/shells.

# sync

### Name

sync — flush file system buffers

# **Synopsis**

sync

# **Description**

Force changed blocks to disk, update the super block.

### tar

### Name

tar — file archiver

# **Description**

tar is as specified in SUSv2, but with differences as listed below.

### **Differences**

Some elements of the Pattern Matching Notation are optional; see <u>Pattern Matching Notation</u>.

-h doesn't dump symlinks; dumps the files they point to.

-z filters the archive through **gzip**.

#### umount

### **Name**

umount — unmount file systems

# **Synopsis**

umount [-hV]umount -a [-nrv] [-t vfstype]umount [-nrv] device | dir

# **Description**

**umount** detaches the file system(s) mentioned from the file hierarchy. A file system is specified by giving the directory where it has been mounted.

# **Standard Options**

 $-\mathbf{v}$ 

invokes verbose mode.

-n

unmounts without writing in /etc/mtab.

-r

tries to remount read-only if unmounting fails.

-a

unmounts all of the file systems described in /etc/mtab except for the proc file system.

-t vfstype

indicates that the actions should only be taken on file systems of the specified type. More than one type may be specified in a comma separated list. The list of file system types can be prefixed with no to specify the file system types on which no action should be taken.

-f

forces unmount (in case of an unreachable NFS system).

# **LSB Deprecated Options**

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

-V

print version and exits.

#### useradd

### **Name**

useradd — create a new user or update default new user information

# **Synopsis**

```
useradd [-c comment] [-d home_dir] [-g initial_group] [-G group...] [-m [-
k skeleton_dir]] [-p passwd] [-r] [-s shell] [-u uid [-o]] login useradd
-D [-g default_group] [-b default_home] [-s default_shell]
```

# **Description**

When invoked without the -D option, and with appropriate privilege, **useradd** creates a new user account using the values specified on the command line and the default values from the system. The new user account will be entered into the system files as needed, the home directory will be created, and initial files copied, depending on the command line options. If the group named *group* does not exist, or the user names *login* already exists, or the user ID *uid* is already in use and no -o option is specified, then **useradd** shall issue a diagnostic message and exit with a non-zero exit status.

When invoked with the -D option, **useradd** will either display the current default values, or, with appropriate privilege, update the default values from the command line. If no options are specified, **useradd** displays the current default values.

The **useradd** command is a system administration utility, see <u>Path For System Administration Utilities</u>.

# **Standard Options**

#### -c comment

specifies the new user's password file comment field value.

#### -d home\_dir

creates the new user using home\_dir as the value for the user's login directory. The default is to append the login name to default\_home and use that as the login directory name.

### -g initial\_group

specifies the group name or number of the user's initial login group. The group name shall exist. A group number shall refer to an already existing group. If -g is not specified, the implementation will follow the normal user default for that system. This may create a new group or choose a default group that normal users are placed in. Applications which require control of the groups into which a user is placed should specify -g.

### -G group[,...]

specifies a list of supplementary groups which the user is also a member of. Each group is separated from the next by a comma, with no intervening whitespace. The groups are subject to the same restrictions as the group given with the -g option. The default is for the user to belong only to the initial group.

#### -m [-k skeleton dir]

#### LSB Core - Generic 5.0

specifies the user's home directory will be created if it does not exist. The files contained in  $skeleton\_dir$  will be copied to the home directory if the -k option is used, otherwise the files contained in /etc/skel will be used instead. Any directories contained in  $skeleton\_dir$  or /etc/skel will be created in the user's home directory as well. The -k option is only valid in conjunction with the -m option. The default is to not create the directory and to not copy any files.

#### p passwd

is the encrypted password, as returned by crypt(). The default is to disable the account.

-r

creates a system account, that is, a user with a User ID in the range reserved for system account users. If there is not a User ID free in the reserved range the command will fail.

#### -s shell

specifies the name of the user's login shell. The default is to leave this field blank, which causes the system to select the default login shell.

#### -u uid [-o]

specifies the numerical value of the user's ID. This value shall be unique, unless the -o option is used. The value shall be non-negative. The default is the smallest ID value greater than 499 which is not yet used.

# **Change Default Options**

#### -b default\_home

specifies the initial path prefix for a new user's home directory. The user's name will be affixed to the end of default\_home to create the new directory name if the -d option is not used when creating a new account.

#### -g default\_group

specifies the group name or ID for a new user's initial group. The named group shall exist, and a numerical group ID shall have an existing entry.

#### -s default\_shell

specifies the name of the new user's login shell. The named program will be used for all future new user accounts.

#### -c comment

specifies the new user's password file comment field value.

# **Application Usage**

The -D option will typically be used by system administration packages. Most applications should not change defaults which will affect other applications and users.

### userdel

### Name

userdel — delete a user account and related files

# **Synopsis**

userdel [-r] login

# **Description**

Delete the user account named *login*. If there is also a group named *login*, this command may delete the group as well, or may leave it alone. If the user named *login* does not exist or is currently logged in, **userdel** shall issue a diagnostic message and exit with a non-zero exit status.

The **userdel** command is a system administration utility, see <u>Path For System Administration Utilities</u>.

# **Options**

-r

removes files in the user's home directory along with the home directory itself. Files located in other file system will have to be searched for and deleted manually.

#### usermod

### **Name**

usermod — modify a user account

# **Synopsis**

```
usermod [-c comment] [-d home_dir [ -m]] [-g initial_group] [-G group
[,...]] [-l login_name] [-p passwd] [-s shell] [-u uid [ -o]] login
```

# **Description**

The **usermod** command shall modify an entry in the user account database.

The **usermod** command is a system administration utility, see <u>Path For System</u> Administration Utilities.

# **Options**

#### -c comment

specifies the new value of the user's password file comment field.

#### -d home\_dir

specifies the user's new login directory. If the -m option is given the contents of the current home directory will be moved to the new home directory, which is created if it does not already exist.

#### -g initial\_group

specifies the group name or number of the user's new initial login group. The group name shall exist. A group number shall refer to an already existing group.

#### -G group,[...]

specifies a list of supplementary groups which the user is also a member of. Each group is separated from the next by a comma, with no intervening whitespace. The groups are subject to the same restrictions as the group given with the -g option. If the user is currently a member of a group which is not listed, the user will be removed from the group.

#### -l login\_name

changes the name of the user from login to login\_name. Nothing else is changed. In particular, the user's home directory name should probably be changed to reflect the new login name.

### -p passwd

is the encrypted password, as returned by crypt(3).

#### -s shell

specifies the name of the user's new login shell. Setting this field to blank causes the system to select the default login shell.

#### -u uid [-o]

specifies the numerical value of the user's ID. This value shall be unique, unless the -o option is used. The value shall be non-negative. Any files which the user owns and which are located in the directory tree rooted at the user's home directory will have the file user ID changed automatically. Files outside of the user's home directory shall be altered manually.

### xargs

### **Name**

xargs — build and execute command lines from standard input

# **Description**

**xargs** is as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, but with differences as listed below.

### **Differences**

-E

has unspecified behavior.

-I

has unspecified behavior.

-L

has unspecified behavior.

**Note:** These options have been implemented in **findutils-4.2.9**, but this version of the utilities is not in widespread use as of April 2005. However, future versions of this specification will require support for these arguments.

#### zcat

### **Name**

zcat — uncompress files to standard output

# **Description**

The **zcat** utility shall behave as described in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, with differences listed below.

The <u>Filesystem Hierarchy Standard</u> requires that if **zcat** exists, it must be a symbolic or hard link to /bin/gzip. This specification additionally allows **zcat** to be a wrapper script which calls **gzip -c -d**.

#### **Differences**

The **zcat** utility shall write to standard output the uncompressed form of files that have been compressed using any of the compression methods supported by the **gzip** utility. It is the equivalent of **gzip -c -d**. Input files are not affected.

# **VII Execution Environment**

# 18 File System Hierarchy

An LSB conforming implementation shall provide the mandatory portions of the file system hierarchy specified in the <u>Filesystem Hierarchy Standard</u> (FHS), together with any additional requirements made in this specification.

An LSB conforming application shall conform to the Filesystem Hierarchy Standard.

The FHS allows many components or subsystems to be optional. An application shall check for the existence of an optional component before using it, and should behave in a reasonable manner if the optional component is not present.

The FHS requirement to locate the operating system kernel in either / or /boot does not apply if the operating system kernel does not exist as a file in the file system.

The FHS specifies certain behaviors for a variety of commands if they are present (for example, **ping** or **python**). However, conforming applications shall not rely on any commands beyond those required by this specification. The mere existence of a command may not be used as an indication that the command behaves in any particular way.

The following directories or links need not be present: /etc/X11 /usr/bin/X11 /usr/lib/X11 /proc

#### 18.1 /dev: Device Files

The devices described in Chapter 6. "Operating System Specific Annex", Section 6.1. "Linux", subsection 6.1.3. "/dev: Devices and special files" in the <u>Filesystem Hierarchy Standard</u> are required on an LSB conforming system. Other devices may also exist in /dev. Device names may exist as symbolic links to other device nodes located in /dev or subdirectories of /dev. There is no requirement concerning major/minor number values.

# 18.2 /etc: Host-specific system configuration

In addition to the requirements for /etc in the <u>Filesystem Hierarchy Standard</u>, an LSB conforming system shall also provide the following directories or symbolic links to directories:

/etc/cron.d

A directory containing extended **crontab** files; see **Cron Jobs**.

/etc/cron.daily

A directory containing shell scripts to be executed once a day; see Cron Jobs.

/etc/cron.hourly

A directory containing shell scripts to be executed once per hour; see Cron Jobs.

/etc/cron.monthly

A directory containing shell scripts to be executed once per month; see Cron Jobs.

/etc/cron.weekly

A directory containing shell scripts to be executed once a week; see Cron Jobs.

/etc/init.d

A directory containing system initialization scripts; see <u>Installation and Removal of Init Scripts</u>.

/etc/profile.d

A directory containing shell scripts. Script names should follow the same conven-

tions as specified for cron jobs (see  $\underline{\text{Cron Jobs}}$ , but should have the suffix .sh. The behavior is unspecified if a script is installed in this directory that does not have the suffix .sh.

The **sh** utility shall read and execute commands in its current execution environment from all the shell scripts in this directory that have the suffix . sh when invoked as an interactive login shell, or if the -1 (the letter *ell*) is specified (see <u>Shell Invocation</u>).

**Future Directions:** These directories are required at this version of the LSB since there is not yet an agreed method for abstracting the implementation so that applications need not be aware of these locations during installation.

# 18.2.1 File Naming Conventions

Conforming implementations and applications installing files into any of the above locations under /etc may only use filenames from the following managed namespaces:

Assigned names. Such names must be chosen from the character set [a-z0-9]. In order to avoid conflicts these names shall be registered. This specification establishes a registry of provider, package and script names which is maintained at the Linux Assigned Names and Numbers Authority (LANANA). See www.lanana.org (http://www.lanana.org) to register names or look up already registered names.

**Note:** Commonly used names should be registered to avoid conflicts and promote name reuse across distributions. Project developers are encouraged to reserve names with the LANANA as early as possible as registration is on a first-come, first-served basis.

- Hierarchical names. Script names in this category take the form: <hier1>-<hier2>-...-<name>, where name is taken from the character set [a-z0-9], and where there may be one or more <hier-n> components. <hier1> may either be an LSB provider name registered with the LANANA, or it may be a domain name registered to the provider in the DNS system, containing at least one '.' (e.g. "debi-an.org", "staroffice.sun.com"). The LSB provider name registered with the LANANA shall only consist of the ASCII characters [a-z0-9].
- Reserved names. Names that begin with the character '\_' are reserved for distribution
  use only. Names in this form should be used for essential system packages only.

**Note:** As this specification cannot enforce rules for applications which do not choose to conform to it, conforming applications need to be aware that the managed namespaces may have been polluted with unregistered filenames and should check for namespace collisions and take appropriate steps if they occur.

In general, if a package or system script is likely to be used on multiple systems, the package developers or the distribution should register the name through the LANANA, and distributions should strive to use the same name whenever possible. For applications which may not be essential or may not be commonly installed, the hierarchical namespace may be more appropriate. An advantage to the hierarchical namespace is that there is no need to consult with the LANANA before using a specific name.

Short names are highly desirable, since system administrators may wish to manually start and stop services. Given this, they should be standardized on a per-package basis. This is the rationale behind having the LANANA organization assign these names. The LANANA may be called upon to handle other namespace issues, such as package/prerequisites naming.

# 18.3 User Accounting Databases

The <u>Filesystem Hierarchy Standard</u> specifies two optional locations for user accounting databases used by the getutent(), getutent\_r(), getutxent(), getutxid(), getutxline(), and pututxline() functions. These are /var/run/utmp and /var/run/wtmp.

The LSB does not specify the format or structure of these files, or even if they are files

#### LSB Core - Generic 5.0

at all. They should be used only as "magic cookies" to the utmpname() function.

# 18.4 Path For System Administration Utilities

Certain utilities used for system administration (and other privileged commands) may be stored in /sbin, /usr/sbin, and /usr/local/sbin. Applications requiring to use commands identified as system administration utilities should add these directories to their PATH. By default, as described in <a href="POSIX 1003.1-2008">POSIX 1003.1-2008</a> (ISO/IEC 9945-2009), standard utilities shall be found on the PATH returned by **getconf PATH** (or **command-p getconf PATH** to be guaranteed to invoke the correct version of **getconf**).

### 19 Additional Recommendations

# 19.1 Recommendations for applications on ownership and permissions

# 19.1.1 Directory Write Permissions

The application should not depend on having directory write permission in any directory except /tmp, /var/tmp, and the invoking user's home directory.

In addition, the application may store variable data in /var/opt/package, (where package is the name of the application package), if such a directory is created with appropriate permissions during the package installation.

For these directories the application should be able to work with directory write permissions restricted by the S\_ISVTXT bit, implementing the restricted deletion mode as described for the XSI option for <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

### 19.1.2 File Write Permissions

The application should not depend on file write permission to any file that it does not itself create.

### 19.1.3 File Read and execute Permissions

The application should not depend on having read permission to every file and directory.

### 19.1.4 SUID and SGID Permissions

The application should not depend on the set user ID or set group ID (the S\_ISUID or S\_ISGID permission bits) permissions of a file not packaged with the application. Instead, the distribution is responsible for assuming that all system commands have the required permissions and work correctly.

**Rationale:** In order to implement common security policies it is strongly advisable for applications to use the minimum set of security attributes necessary for correct operation. Applications that require substantial appropriate privilege are likely to cause problems with such security policies.

# 19.1.5 Privileged users

In general, applications should not depend on running as a privileged user. This specification uses the term "appropriate privilege" throughout to identify operations that cannot be achieved without some special granting of additional privilege.

Applications that have a reason to run with appropriate privilege should outline this reason clearly in their documentation. Users of the application should be informed, that "this application demands security privileges, which could interfere with system security".

The application should not contain binary-only software that requires being run with appropriate privilege, as this makes security auditing harder or even impossible.

# 19.1.6 Changing permissions

The application shall not change permissions of files and directories that do not belong to its own package. Should an application require that certain files and directories not directly belonging to the package have a particular ownership, the application shall document this requirement, and may fail during installation if the permissions on these files

is inappropriate.

# 19.1.7 Removable Media (Cdrom, Floppy, etc.)

Applications that expect to be runnable from removable media should not depend on logging in as a privileged user, and should be prepared to deal with a restrictive environment. Examples of such restrictions could be default mount options that disable setuser/group-ID attributes, disabling block or character-special files on the medium, or remapping the user and group IDs of files away from any privileged value.

**Rationale:** System vendors and local system administrators want to run applications from removable media, but want the possibility to control what the application can do.

# 19.1.8 Installable applications

Where the installation of an application needs additional privileges, it must clearly document all files and system databases that are modified outside of those in /opt/pkg-name, /etc/opt/pkg-name, and /var/opt/pkg-name, other than those that may be updated by system logging or auditing activities.

Without this, the local system administrator would have to blindly trust a piece of software, particularly with respect to its security.

### 20 Additional Behaviors

### 20.1 Mandatory Optional Behaviors

This section specifies behaviors in which there is optional behavior in one of the standards on which this specification relies, and where this specification requires a specific behavior.

**Note:** This specification does not require the kernel to be Linux; the set of mandated options reflects current existing practice, but may be modified in future releases.

LSB conforming implementations shall support the following options defined within the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*:

```
_POSIX_FSYNC
_POSIX_MAPPED_FILES
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MEMORY_PROTECTION
_POSIX_PRIORITY_SCHEDULING
_POSIX_REALTIME_SIGNALS
_POSIX_THREAD_ATTR_STACKADDR
_POSIX_THREAD_ATTR_STACKSIZE
_POSIX_THREAD_PROCESS_SHARED
_POSIX_THREAD_SAFE_FUNCTIONS
_POSIX_THREADS
```

The opendir() function shall consume a file descriptor in the same fashion as open(), and therefore may fail with EMFILE or ENFILE.

The START and STOP termios characters shall be changeable, as described as optional behavior in the "General Terminal Interface" section of the <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009).

The access() function function shall fail with errno set to EINVAL if the *amode* argument contains bits other than those set by the bitwise inclusive OR of R\_OK, W\_OK, X\_OK and F\_OK.

The link() function shall require access to the existing file in order to succeed, as described as optional behavior in the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*.

Calling unlink() on a directory shall fail. Calling link() specifying a directory as the first argument shall fail. See also unlink.

**Note:** Linux allows rename() on a directory without having write access, but this specification does not require this behavior.

# 20.1.1 Special Requirements

LSB conforming systems shall enforce certain special additional restrictions above and beyond those required by <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

**Note:** These additional restrictions are required in order to support the testing and certification programs associated with the LSB. In each case, these are values that defined macros must not have; conforming applications that use these values shall trigger a failure in the interface that is otherwise described as a "may fail".

The fcntl() function shall treat the "cmd" value -1 as invalid.

The whence value -1 shall be an invalid value for the lseek(), fseek() and fcntl() functions.

The value -5 shall be an invalid signal number.

If the sigaddset() or sigdelset() functions are passed an invalid signal number, they shall return with EINVAL. Implementations are only required to enforce this requirement for signal numbers which are specified to be invalid by this specification (such as the -5 mentioned above).

The mode value -1 to the access() function shall be treated as invalid.

A value of -1 shall be an invalid "\_PC\_..." value for pathconf().

A value of -1 shall be an invalid "\_SC..." value for sysconf().

The *nl\_item* value -1 shall be invalid for nl\_langinfo().

The value -1 shall be an invalid "\_CS\_..." value for confstr().

The value "a" shall be an invalid *mode* argument to popen().

The fcntl() function shall fail and set errno to EDEADLK if the *cmd* argument is F\_SETLKW, and the lock is blocked by a lock from another process already blocked by the current process.

The opendir() function shall consume a file descriptor; the readdir() function shall fail and set errno to EBADF if the underlying file descriptor is closed.

The link() function shall not work across file systems, and shall fail and set errno to EXDEV as described as optional behavior in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>.

### 20.2 Optional Mandatory Behaviors

This section specifies behaviors that are mandatory in one of the standards on which this specification relies, but which are optional in this specification.

<u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u> describes the behavior of the file access time, available as the *st\_atime* field of the stat and stat64 structures. An LSB conforming implementation need not update this information every time a file is accessed.

**Note:** A subsequent edition of the POSIX standard no longer mandates updating of *st\_atime* but the older edition is still the guiding standard for this specification, thus this exception is needed.

# 20.3 Executable Scripts

An executable script is an executable file of which the first two characters are #! as defined in the portable character set. In <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, this construct is undefined, but reserved for implementations which wish to provide this functionality. LSB conforming implementations shall support executable scripts.

A successful call to a function of the exec family with an executable script as the first parameter shall result in a new process, where the process image started is that of the interpreter. The path name of the interpreter follows the #! characters.

If the executable script has a first line

```
#! interpreter [arg]
```

then *interpreter* shall be called with an argument array consisting of an unspecified zeroth argument, followed by *arg* (if present), followed by a path name for the script, followed by the arguments following the zeroth argument in the exec call of the script.

The interpreter shall not perform any operations on the first line of an executable script.

The first line of the executable script shall meet all of the following criteria otherwise the results are unspecified:

1. Is of one of the forms:

#!interpreter

#### LSB Core - Generic 5.0

```
#! interpreter
#!interpreter arg
#! interpreter arg
```

- 2. The *interpreter* argument is an absolute pathname of an executable file other than an executable script.
- 3. Neither the *interpreter* argument nor the *arg* argument, if present, contain any quoting characters.
- 4. Neither the *interpreter* argument nor the *arg* argument, if present, contain any whitespace characters.
- 5. The length of the entire line is no longer than 80 bytes.

If the interpreter is required by this specification to be in a specific named directory, a conforming application must use that path for <code>interpreter</code>, as implementations are not prohibited from having other, possibly non-conforming, versions of the same interpreter installed on the system. If the interpreter is a required command in this specification, but does not have a required path, the application should take special measures to insure the appropriate version is selected. If the interpreter is not a required command in this specification, the application must make appropriate provisions that the interpreter is available at the appropriate path.

**Note:** In case the path is not specified, it is recommended that an installation script for executable scripts use the standard PATH returned by a call to the **getconf** command with the argument *PATH*, combined with the **command** command to determine the location of a standard command.

For example to determine the location of the standard awk command:

```
PATH=`getconf PATH` command -v awk
```

The installation script should ensure that the returned pathname is an absolute pathname prior to use, since a shell builtin might be returned for some utilities.

Use of the common form #!/usr/bin/env interpreter is not recommended as the PATH will be unknown at execution time and an alternative version of *interpreter* might be selected.

### 21 Localization

### 21.1 Introduction

In order to install a message catalog, the installation procedure shall supply the message catalog in a format readable by the **msgfmt** command, which shall be invoked to compile the message catalog into an appropriate binary format on the target system.

**Rationale:** The original intent was to allow an application to contain the binary GNU MO format files. However, the format of these files is not officially stable, hence it is necessary to compile these catalogs on the target system. These binary catalogs may differ from architecture to architecture as well.

The resulting binary message catalog shall be located in the package's private area under /opt, and the application may use bindtextdomain() to specify this location.

Implementations shall support the POSIX and C locales as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>. Other locales may be supported.

Implementations may define additional locale categories not defined by that standard.

**Note:** Implementations choosing additional locale categories should be aware of <u>ISO/IEC TR14652</u> and are advised not to choose names that conflict with that specification. If implementations provide locale categories whose names are part of the FDCC set of <u>ISO/IEC TR14652</u>, they should behave as defined by that specification.

# 21.2 Regular Expressions

Utilities that process regular expressions shall support Basic Regular Expressions and Extended Regular Expressions as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, with the following exceptions:

Range expression (such as [a-z]) can be based on code point order instead of collating element order.

Equivalence class expression (such as [=a=]) and multi-character collating element expression (such as [.ch.]) are optional.

Handling of a multi-character collating element is optional.

This affects at least the following utilities:

- awk (see <u>awk</u>)
- grep (see grep) (including egrep, see egrep)
- sed (see sed)

It also affects the behavior of interfaces in the base libraries, including at least

• regexec() (see regexec)

# 21.3 Pattern Matching Notation

Utilities that perform filename pattern matching (also known as Filename Globbing) shall do it as specified in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, Pattern Matching Notation, with the following exceptions:

Pattern bracket expressions (such as [a-z]) can be based on code point order instead of collating element order.

Equivalence class expression (such as [=a=]) and multi-character collating element expression (such as [.ch.]) are optional.

Handling of a multi-character collating element is optional.

This affects at least the following utilities: cpio (cpio), find and tar (tar).

# **VIII System Initialization**

# 22 System Initialization

### 22.1 Cron Jobs

In addition to the individual user crontab files specified by <u>POSIX 1003.1-2008</u> (ISO/IEC 9945-2009), which are located in /var/spool/cron as specified by the <u>Filesystem Hierarchy Standard</u> (FHS), the process that executes scheduled commands shall also process the following additional crontab files, which are in a different format (see below). /etc/crontab, /etc/cron.d/\*. The installation of a package shall not modify the crontab file /etc/crontab, and shall not directly modify the user crontab files in /var/spool/cron/crontabs. but may use the **crontab** command to modify the latter.

If a package wishes to install a job that has to be executed periodically, it shall place an executable *cron script* in one of the following directories:

```
/etc/cron.hourly
/etc/cron.daily
/etc/cron.weekly
/etc/cron.monthly
```

As these directory names suggest, the files within them are executed on a hourly, daily, weekly, or monthly basis, respectively, under the control of an entry in one of the system crontab files, at an unspecified time of day. See below for the rules concerning the names of cron scripts.

**Note:** It is recommended that cron scripts installed in any of these directories be script files rather than compiled binaries so that they may be modified by the local system administrator. Conforming applications may only install cron scripts which use an interpreter required by this specification or provided by this or another conforming application.

This specification does not define the concept of a package *upgrade*. Implementations may do different things when packages are upgraded, including not replacing a cron script if it marked as a configuration file, particularly if the cron script appears to have been modified since installation. In some circumstances, the cron script may not be removed when the package is uninstalled. Applications should design their installation procedure and cron scripts to be robust in the face of such behavior. In particular, cron scripts should not fail obscurely if run in unexpected circumstances. Testing for the existence of application binaries before executing them is suggested.

If a certain task has to be executed at other than the predefined frequencies, the package shall install a file /etc/cron.d/cron-name. The file shall have the same format as that described for the **crontab** command in <u>POSIX 1003.1-2008 (ISO/IEC 9945-2009)</u>, except that there shall be an additional field, *username*, before the name of the command to execute. For completeness, the seven fields shall be:

- 1. Minute [0,59]
- 2. Hour [0,23]
- 3. Day of the month [1,31]
- 4. Month of the year [1,12]
- 5. Day of the week [0,6] (with 0=Sunday)
- 6. Username
- 7. command [args ...]

This file shall be processed by the system automatically, with the named command being run at the specified time, as the specified username.

Applications installing files in these directories shall use the LSB naming conventions (see File Naming Conventions).

### 22.2 Init Script Actions

Conforming applications which need to execute commands on changes to the system run level (including boot and shutdown), may install one or more *init scripts*. Init scripts provided by conforming applications shall accept a single argument which selects the action:

startstart the servicestopstop the service

**restart** stop and restart the service if the service

is already running, otherwise start the

service

**try-restart** restart the service if the service is already

running

**reload** cause the configuration of the service to

be reloaded without actually stopping and

restarting the service

**force-reload** cause the configuration to be reloaded if

the service supports this, otherwise restart

the service if it is running

**status** print the current status of the service

The **start**, **stop**, **restart**, **force-reload**, and **status** actions shall be supported by all init scripts; the **reload** and the **try-restart** actions are optional. Other init-script actions may be defined by the init script.

Init scripts shall ensure that they will behave sensibly if invoked with **start** when the service is already running, or with **stop** when not running, and that they do not kill similarly-named user processes. The best way to achieve this is to use the init-script functions provided by /lib/lsb/init-functions (see <u>Init Script Functions</u>)

If a service reloads its configuration automatically (as in the case of cron, for example), the **reload** action of the init script shall behave as if the configuration was reloaded successfully. The **restart**, **try-restart**, **reload** and **force-reload** actions may be atomic; that is if a service is known not to be operational after a restart or reload, the script may return an error without any further action.

**Note:** This specification does not define the concept of a package *upgrade*. Implementations may do different things when packages are upgraded, including not replacing an init script if it is marked as a configuration file, particularly if the file appears to have been modified since installation. In some circumstances, the init script may not be removed when the package is uninstalled. Applications should design their installation procedure and init scripts to be robust in the face of such behavior. In particular, init scripts should not fail obscurely if run in unexpected circumstances. Testing for the existence of application binaries before executing them is suggested.

If the **status** action is requested, the init script will return the following exit status codes.

0	program is running or service is OK
1	program is dead and /var/run pid file ex-
	ists
2	program is dead and /var/lock lock file
	exists
3	program is not running
4	program or service status is unknown
5-99	reserved for future LSB use
100-149	reserved for distribution use
150-199	reserved for application use
200-254	reserved

For all other init-script actions, the init script shall return an exit status of zero if the action was successful. Otherwise, the exit status shall be non-zero, as defined below. In addition to straightforward success, the following situations are also to be considered successful:

#### LSB Core - Generic 5.0

- restarting a service (instead of reloading it) with the force-reload argument
- · running start on a service already running
- running **stop** on a service already stopped or not running
- running restart on a service already stopped or not running
- running try-restart on a service already stopped or not running

In case of an error while processing any init-script action except for **status**, the init script shall print an error message and exit with a non-zero status code:

1	generic or unspecified error (current prac-
	tice)
2	invalid or excess argument(s)
3	unimplemented feature (for example, "re-
	load")
4	user had insufficient privilege
5	program is not installed
6	program is not configured
7	program is not running
8-99	reserved for future LSB use
100-149	reserved for distribution use
150-199	reserved for application use
200-254	reserved

Error and status messages should be printed with the logging functions (see <a href="Init Script Functions">Init Script Functions</a>) log\_success\_msg(), log\_failure\_msg() and log\_warning\_msg(). Scripts may write to standard error or standard output, but implementations need not present text written to standard error/output to the user or do anything else with it.

**Note:** Since init scripts may be run manually by a system administrator with non-standard environment variable values for PATH, USER, LOGNAME, etc., init scripts should not depend on the values of these environment variables. They should set them to some known/default values if they are needed.

# 22.3 Comment Conventions for Init Scripts

Conforming applications may install one or more init scripts. These init scripts must be activated by invoking the **install\_initd** command. Prior to package removal, the changes applied by **install\_initd** must be undone by invoking **remove\_initd**. See <u>Installation and Removal of Init Scripts</u> for more details.

**install\_initd** and **remove\_initd** determine actions to take by decoding a specially formatted block of lines in the script. This block shall be delimited by the lines

```
### BEGIN INIT INFO
### END INIT INFO
```

The delimiter lines may contain trailing whitespace, which shall be ignored. All lines inside the block shall begin with a hash character '#' in the first column, so the shell interprets them as comment lines which do not affect operation of the script. The lines shall be of the form:

```
# {keyword}: arg1 [arg2...]
```

with exactly one space character between the '#' and the keyword, with a single exception. In lines following a line containing the **Description** keyword, and until the next keyword or block ending delimiter is seen, a line where the '#' is followed by more than one space or a tab character shall be treated as a continuation of the previous line.

The information extracted from the block is used by the installation tool or the init-script system to assure that init scripts are run in the correct order. It is unspecified whether the information is evaluated only when **install\_initd** runs, when the init scripts are ex-

ecuted, or both. The information extracted includes run levels, defined in <u>Run Levels</u>, and boot facilities, defined in <u>Facility Names</u>.

The following keywords, with their arguments, are defined:

```
Provides: boot_facility_1 [boot_facility_2...]
```

boot facilities provided by this init script. When an init script is run with a **start** argument, the boot facility or facilities specified by the **Provides** keyword shall be deemed present and hence init scripts which require those boot facilities should be started later. When an init script is run with a **stop** argument, the boot facilities specified by the **Provides** keyword are deemed no longer present.

```
Required-Start: boot_facility_1 [boot_facility_2...]
```

facilities which must be available during startup of this service. The init-script system should insure init scripts which provide the **Required-Start** facilities are started before starting this script.

```
Required-Stop: boot_facility_1 [boot_facility_2...]
```

facilities which must be available during the shutdown of this service. The initscript system should avoid stopping init scripts which provide the **Required-Stop** facilities until this script is stopped.

```
Should-Start: boot_facility_1 [boot_facility_2...]
```

facilities which, if present, should be available during startup of this service. This allows for weak dependencies which do not cause the service to fail if a facility is not available. The service may provide reduced functionality in this situation. Conforming applications should not rely on the existence of this feature.

```
Should-Stop: boot_facility_1 [boot_facility_2...]
```

facilities which should be available during shutdown of this service.

```
Default-Start: run_level_1 [run_level_2...]
Default-Stop: run_level_1 [run_level_2...]
```

which run levels should by default run the init script with a **start** (**stop**) argument to start (stop) the services controlled by the init script.

For example, if a service should run in runlevels 3, 4, and 5 only, specify "Default-Start: 3 4 5" and "Default-Stop: 0 1 2 6".

```
Short-Description: short_description
```

provide a brief description of the actions of the init script. Limited to a single line of text.

```
Description: multiline_description
```

provide a more complete description of the actions of the init script. May span mulitple lines. In a multiline description, each continuation line shall begin with a '#' followed by tab character or a '#' followed by at least two space characters. The multiline description is terminated by the first line that does not match this criteria.

Additional keywords may be defined in future versions of this specification. Also, implementations may define local extensions by using the prefix **X-implementor**. For example, **X-RedHat-foobardecl**, or **X-Debian-xyzzydecl**.

Example:

```
### BEGIN INIT INFO
    # Provides: lsb-ourdb
    # Required-Start: $local_fs $network $remote_fs
    # Required-Stop: $local_fs $network $remote_fs
```

#### LSB Core - Generic 5.0

```
# Default-Start: 2 3 4 5
# Default-Stop: 0 1 6
# Short-Description: start and stop OurDB
# Description: OurDB is a very fast and reliable database
# engine used for illustrating init scripts
### END INIT INFO
```

The comment conventions described in this section are only required for init scripts installed by conforming applications. Conforming runtime implementations are not required to use this scheme in their system provided init scripts.

**Note:** This specification does not require, but is designed to allow, the development of a system which runs init scripts in parallel. Hence, enforced-serialization of scripts is avoided unless it is explicitly necessary.

# 22.4 Installation and Removal of Init Scripts

Conforming applications may install one or more initialization scripts (or *init scripts*). An init script shall be installed in /etc/init.d (which may be a symbolic link to another location), by the package installer.

During the installer's post-install processing phase the program /usr/lib/lsb/install\_initd must be called to activate the init script. Activation consists of arranging for the init script to be called in the correct order on system run-level changes (including system boot and shutdown), based on dependencies supplied in the init script (see Comment Conventions for Init Scripts). The install\_initd command should be thought of as a wrapper which hides the implementation details; how any given implementation arranges for the init script to be called at the appropriate time is not specified.

Example: if an init script specified "Default-Start: 3 4 5" and "Default-Stop: 0 1 2 6", install\_initd might create "start" symbolic links with names starting with 'S' in /etc/rc3.d, /etc/rc4.d and /etc/rc5.d and "stop" symbolic links with names starting with 'K' in /etc/rc0.d, /etc/rc1.d, /etc/rc2.d and /etc/rc6.d. Such a scheme would be similar to the System V Init mechanism, but is by no means the only way this specification could be implemented.

The **install\_initd** command takes a single argument, the full pathname of the installed init script. The init script must already be installed in /etc/init.d. The **install\_initd** command will not copy it there, only activate it once it has been installed. For example:

```
/usr/lib/lsb/install_initd /etc/init.d/example.com-coffeed
```

The **install\_initd** command shall return an exit status of zero if the init-script activation was successful or if the init script was already activated. If the dependencies in the init script (see <u>Comment Conventions for Init Scripts</u>) cannot be met, an exit status of one shall be returned and the init script shall not be activated.

When a software package is removed, /usr/lib/lsb/remove\_initd must be called to deactivate the init script. This must occur before the init script itself is removed, as the dependency information in the script may be required for successful completion. Thus the installer's pre-remove processing phase must call remove\_initd, and pass the full pathname of the installed init script. The package installer is still responsible for removing the init script. For example:

```
/usr/lib/lsb/remove_initd /etc/init.d/example.com-coffeed
```

The **remove\_initd** program shall return an exit status of zero if the init script has been successfully deactivated or if the init script is not activated. If another init script which depends on a boot facility provided by this init script is activated, an exit status of one shall be returned and the init script shall remain activated. The installer must fail on such an exit code so it does not subsequently remove the init script.

Note: This specification does not describe a mechanism for the system administrator to

manipulate the run levels at which an init script is started or stopped. There is no assurance that modifying the comment block for this purpose will have the desired effect.

#### 22.5 Run Levels

The following *run levels* are specified for use by the **Default-Start** and **Default-Stop** actions defined in <u>Comment Conventions for Init Scripts</u> as hints to the **install\_initd** command. Conforming implementations are not required to provide these exact run levels or give them the meanings described here, and may map any level described here to a different level which provides the equivalent functionality. Applications may not depend on specific run-level numbers.

0	halt
1	single user mode
2	multiuser with no network services
	exported
3	normal/full multiuser
4	reserved for local use, default is
	normal/full multiuser
5	multiuser with a display manager or
	equivalent
6	reboot

**Note:** These run levels were chosen as reflecting the most frequent existing practice, and in the absence of other considerations, implementors are strongly encouraged to follow this convention to provide consistency for system administrators who need to work with multiple distributions.

# 22.6 Facility Names

Boot *facilities* are used to indicate dependencies in initialization scripts, as defined in <u>Comment Conventions for Init Scripts</u>. Facility names are assigned to scripts by the **Provides:** keyword. Facility names that begin with a dollar sign ('\$') are reserved system facility names.

**Note:** Facility names are only recognized in the context of the init script comment block and are not available in the body of the init script. In particular, the use of the leading '\$' character does not imply system facility names are subject to shell variable expansion, since they appear inside comments.

Conforming applications shall not provide facilities that begin with a dollar sign. Implementations shall provide the following facility names:

#### \$local fs

all local file systems are mounted

### \$network

basic networking support is available. Example: a server program could listen on a socket.

#### \$named

IP name-to-address translation, using the interfaces described in this specification, are available to the level the system normally provides them. Example: if a DNS query daemon normally provides this facility, then that daemon has been started.

### \$portmap

daemons providing SunRPC/ONCRPC portmapping service as defined in <a href="RFC"><u>RFC 1833: Binding Protocols for ONC RPC Version 2</u> (if present) are running.</a>

#### \$remote\_fs

all remote file systems are available. In some configurations, file systems such as /usr may be remote. Many applications that require **\$local\_fs** will probably also require **\$remote\_fs**.

#### \$syslog

system logger is operational.

#### \$time

the system time has been set, for example by using a network-based time program such as **ntp** or **rdate**, or via the hardware Real Time Clock.

Other (non-system) facilities may be defined by other conforming applications. These facilities shall be named using the same conventions defined for naming init scripts (see <a href="Script Names">Script Names</a>). Commonly, the facility provided by a conforming init script will have the same name as the name assigned to the init script.

### 22.7 Script Names

Since init scripts live in a single directory, they must share a single namespace. To avoid conflicts, applications installing files in this directories shall use the LSB naming conventions (see <u>File Naming Conventions</u>).

### 22.8 Init Script Functions

Each conforming init script shall execute the commands in the file /lib/lsb/init-functions in the current environment (see shell special built-in command **dot**). This file shall cause the following shell script commands to be defined in an unspecified manner.

**Note:** This can be done either by adding a directory to the PATH variable which defines these commands, or by defining shell aliases or functions.

Although the commands made available via this mechanism need not be conforming applications in their own right, applications that use them should only depend on features described in this specification.

Conforming scripts shall not specify the "exit on error" option (i.e. set -e) when sourcing this file, or calling any of the commands thus made available.

The **start\_daemon**, **killproc** and **pidofproc** functions shall use the following algorithm for determining the status and the process identifiers of the specified program.

- 1. If the -p pidfile option is specified, and the named pidfile exists, a single line at the start of the pidfile shall be read. If this line contains one or more numeric values, separated by spaces, these values shall be used. If the -p pidfile option is specified and the named pidfile does not exist, the functions shall assume that the daemon is not running.
- 2. Otherwise, /var/run/basename.pid shall be read in a similar fashion. If this contains one or more numeric values on the first line, these values shall be used. Optionally, implementations may use unspecified additional methods to locate the process identifiers required.

The method used to determine the status is implementation defined, but should allow for non-binary programs.

**Note:** Commonly used methods check either for the existence of the /proc/pid directory or use /proc/pid/exe and /proc/pid/cmdline. Relying only on /proc/pid/exe is discouraged since this specification does not specify the existence of, or semantics for, /proc. Additionally, using /proc/pid/exe may result in a not-running status for daemons that are written in a script language.

Conforming implementations may use other mechanisms besides those based on pidfiles, unless the -p pidfile option has been used. Conforming applications should not rely on such mechanisms and should always use a pidfile. When a program is stopped, it should delete its pidfile. Multiple process identifiers shall be separated by a single space in the pidfile and in the output of **pidofproc**.

### start\_daemon [-f] [-n nicelevel] [-p pidfile] pathname [args...]

runs the specified program as a daemon. The **start\_daemon** function shall check if the program is already running using the algorithm given above. If so, it shall not start another copy of the daemon unless the -f option is given. The -n option specifies a nice level. See **nice**. **start\_daemon** shall return the LSB defined exit status codes. It shall return 0 if the program has been successfully started or is running and not 0 otherwise.

#### killproc [-p pidfile] pathname [signal]

The **killproc** function shall stop the specified program. The program is found using the algorithm given above. If a signal is specified, using the <code>-signal\_name</code> or <code>-signal\_number</code> syntaxes as specified by the **kill** command, the program is sent that signal. Otherwise, a SIGTERM followed by a SIGKILL after an unspecified number of seconds shall be sent. If a program has been terminated, the <code>pidfile</code> should be removed if the terminated process has not already done so. The **killproc** function shall return the LSB defined exit status codes. If called without a signal, it shall return 0 if the program has been stopped or is not running and not 0 otherwise. If a signal is given, it shall return 0 only if the program is running.

#### pidofproc [-p pidfile] pathname

The **pidofproc** function shall return one or more process identifiers for a particular daemon using the algorithm given above. Only process identifiers of running processes should be returned. Multiple process identifiers shall be separated by a single space.

**Note:** A process may exit between **pidofproc** discovering its identity and the caller of **pidofproc** being able to act on that identity. As a result, no test assertion can be made that the process identifiers returned by **pidofproc** *shall* be running processes.

The **pidofproc** function shall return the LSB defined exit status codes for "status". It shall return 0 if the program is running and not 0 otherwise.

### log\_success\_msg message

The log\_success\_msg function shall cause the system to write a success message to an unspecified log file. The format of the message is unspecified. The log success msg function may also write a message to the standard output.

**Note:** The message should be relatively short; no more than 60 characters is highly desirable.

#### log\_failure\_msg message

The **log\_failure\_msg** function shall cause the system to write a failure message to an unspecified log file. The format of the message is unspecified. The **log\_failure\_msg** function may also write a message to the standard output.

**Note:** The message should be relatively short; no more than 60 characters is highly desirable.

#### log\_warning\_msg message

The **log\_warning\_msg** function shall cause the system to write a warning message to an unspecified log file. The format of the message is unspecified. The **log\_warning\_msg** function may also write a message to the standard output.

### LSB Core - Generic 5.0

**Note:** The message should be relatively short; no more than 60 characters is highly desirable.

# IX Users & Groups

# 23 Users & Groups

### 23.1 User and Group Database

The format of the User and Group databases is not specified. Programs may only read these databases using the provided API. Changes to these databases should be made using the provided commands.

# 23.2 User & Group Names

<u>Table 23-1</u> describes required mnemonic user and group names. This specification makes no attempt to numerically assign user or group identity numbers, with the exception that both the User ID and Group ID for the user root shall be equal to 0.

**Table 23-1 Required User & Group Names** 

User	Group	Comments
root	root	Administrative user with all appropriate privileges
bin	bin	Legacy User ID/Group ID <sup>a</sup>
daemon	daemon	Legacy User ID/Group ID <sup>b</sup>

#### Notes

- a The bin User ID/Group ID is included for compatibility with legacy applications. New applications should no longer use the bin User ID/Group ID.
- b The daemon User ID/Group ID was used as an unprivileged User ID/Group ID for daemons to execute under in order to limit their access to the system. Generally daemons should now run under individual User ID/Group IDs in order to further partition daemons from one another.

<u>Table 23-2</u> is a table of optional mnemonic user and group names. This specification makes no attempt to numerically assign uid or gid numbers. If the username exists on a system, then they should be in the suggested corresponding group. These user and group names are for use by distributions, not by applications.

**Table 23-2 Optional User & Group Names** 

User	Group	Comments
adm	adm	Administrative special privileges
lp	lp	Printer special privileges
sync	sync	Login to sync the system
shutdown	shutdown	Login to shutdown the system
halt	halt	Login to halt the system
mail	mail	Mail special privileges
news	news	News special privileges
uucp	uucp	UUCP special privileges
operator	root	Operator special privileges
man	man	Man special privileges
nobody	nobody	Used by NFS

Only a minimum working set of "user names" and their corresponding "user groups" are required. Applications cannot assume non system user or group names will be defined.

Applications cannot assume any policy for the default file creation mask (**umask**) or the default directory permissions a user may have. Applications should enforce user only file permissions on private files such as mailboxes. The location of the users home directory is also not defined by policy other than the recommendations of the <u>Filesystem Hierarchy Standard</u> and should be obtained by the <code>getpwnam()</code>, <code>getpwnam\_r()</code>, <code>getpwuid()</code>, and <code>getpwuid\_r()</code> functions.

# 23.3 User ID Ranges

The system User IDs from 0 to 99 should be statically allocated by the system, and shall not be created by applications.

The system User IDs from 100 to 499 should be reserved for dynamic allocation by system administrators and post install scripts using **useradd**.

### 23.4 Rationale

The purpose of specifying optional users and groups is to reduce the potential for name conflicts between applications and distributions.

# **X Network Security Services**

### 24 Libraries

### 24.1 Interfaces for libnspr4

Table 24-1 defines the library name and shared object name for the library

**Table 24-1 libnspr4 Definition** 

Library:	libnspr4
SONAME:	libnspr4.so

The behavior of the interfaces in this library is specified by the following specifications: [NSPR] NSPR Reference

# 24.1.1 Netscape Portable Runtime

### 24.1.1.1 Interfaces for Netscape Portable Runtime

An LSB conforming implementation shall provide the generic functions for Netscape Portable Runtime specified in <u>Table 24-2</u>, with the full mandatory functionality as described in the referenced underlying specification.

# 24.2 Data Definitions for libnspr4

This section defines global identifiers and their values that are associated with interfaces contained in libnspr4. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

#### 24.3 Interfaces for libnss3

Table 24-3 defines the library name and shared object name for the library

**Table 24-3 libnss3 Definition** 

Library:	libnss3
SONAME:	libnss3.so

The behavior of the interfaces in this library is specified by the following specifications: [NSS SSL] Mozilla's NSS SSL Reference

## 24.3.1 NSS Utility

#### 24.3.1.1 Interfaces for NSS Utility

An LSB conforming implementation shall provide the generic functions for NSS Utility specified in <u>Table 24-4</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 24-4 libnss3 - NSS Utility Function Interfaces

Table 24-4 fibrisss - 1055 Ctility Function Interfaces

#### 24.4 Data Definitions for libras 3

This section defines global identifiers and their values that are associated with interfaces contained in libnss3. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

### 24.5 Interfaces for libssl3

<u>Table 24-5</u> defines the library name and shared object name for the libssl3 library

**Table 24-5 libssl3 Definition** 

Library:	libssl3
SONAME:	libssl3.so

The behavior of the interfaces in this library is specified by the following specifications: [NSS SSL] Mozilla's NSS SSL Reference

### 24.5.1 NSS SSL

#### 24.5.1.1 Interfaces for NSS SSL

An LSB conforming implementation shall provide the generic functions for NSS SSL specified in <u>Table 24-6</u>, with the full mandatory functionality as described in the referenced underlying specification.

Table 24-6 libssl3 - NSS SSL Function Interfaces

1 able 24-6 libssi3 - NSS SSI	T unction interfaces

### 24.6 Data Definitions for libssl3

This section defines global identifiers and their values that are associated with interfaces contained in libss13. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as re-

quiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the <u>ISO C (1999)</u> C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

# XI Package Format and Installation

## 25 Software Installation

## 25.1 Introduction

Applications shall either be packaged in the RPM packaging format as defined in this specification, or supply an installer which is LSB conforming (for example, calls LSB commands and utilities).

**Note:** Supplying an RPM format package is encouraged because it makes systems easier to manage. This specification does not require the implementation to use RPM as the package manager; it only specifies the format of the package file and requires that implementations must have some method of installing conforming packages.

Applications are also encouraged to uninstall cleanly.

A package in the RPM format may include a dependency on the LSB Core and other LSB specifications, as described in <u>Section 25.6</u>. Packages that are not in the RPM format may test for the presence of a conforming implementation by means of the **lsb\_release** utility.

Implementations shall provide a mechanism for installing applications in the RPM packaging format with some restrictions listed below.

**Note:** The implementation itself may use a different packaging format for its own packages, and may use any available mechanism for installing conforming packages, including translation into a different format.

## 25.2 Package File Format

An RPM format file consists of 4 sections, the Lead, Signature, Header, and the Payload. All values are stored in network byte order.

### **Table 25-1 RPM File Format**

Lead
Signature
Header
Payload

These 4 sections shall exist in the order specified.

The lead section is used to identify the package file.

The signature section is used to verify the integrity, and optionally, the authenticity of the majority of the package file.

The header section contains all available information about the package. Entries such as the package's name, version, and file list, are contained in the header.

The payload section holds the files to be installed.

## 25.2.1 Lead Section

```
struct rpmlead {
   unsigned char magic[4];
   unsigned char major, minor;
   short type;
   short archnum;
   char name[66];
   short osnum;
   short signature_type;
   char reserved[16];
};
```

## magic

Value identifying this file as an RPM format file. This value shall be  $355\253\356\333$ ".

#### major

Value indicating the major version number of the file format version. This value shall be 3.

#### minor

Value indicating the minor revision number of file format version. This value shall be 0

#### type

Value indicating whether this is a source or binary package. This value shall be 0 to indicate a binary package.

#### archnum

Value indicating the architecture for which this package is valid. This value is specified in the relevant architecture specific part of the LSB Core Specification.

#### name

A NUL terminated string that provides the package name. This name shall conform with the Package Naming Conventions section of this specification.

#### osnum

Value indicating the Operating System for which this package is valid. This value shall be 1.

## signature\_type

Value indicating the type of the signature used in the Signature part of the file. This value shall be 5.

#### reserved

Reserved space. The value is undefined.

## 25.2.2 Header Structure

The Header structure is used for both the Signature and Header Sections. A Header Structure consists of 3 parts, a Header record, followed by 1 or more Index records, followed by 0 or more bytes of data associated with the Index records. A Header structure shall be aligned to an 8 byte boundary.

## **Table 25-2 Signature Format**

```
Header Record
Array of Index Records
Store of Index Values
```

### 25.2.2.1 Header Record

```
struct rpmheader {
   unsigned char magic[4];
   unsigned char reserved[4];
   int nindex;
   int hsize;
};
```

## magic

Value identifying this record as an RPM header record. This value shall be " $216\255\350\001$ ".

#### reserved

Reserved space. This value shall be "\000\000\000\000".

#### nindex

The number of Index Records that follow this Header Record. There should be at least 1 Index Record.

#### hsize

The size in bytes of the storage area for the data pointed to by the Index Records.

## 25.2.2.2 Index Record

```
struct rpmhdrindex {
    int tag;
    int type;
    int offset;
    int count;
};
```

Value identifying the purpose of the data associated with this Index Record. The value of this field is dependent on the context in which the Index Record is used, and is defined below and in later sections.

#### type

Value identifying the type of the data associated with this Index Record. The possible *type* values are defined below.

#### offset

Location in the Store of the data associated with this Index Record. This value should between 0 and the value contained in the *hsize* of the Header Structure.

### count

Size of the data associated with this Index Record. The *count* is the number of elements whose size is defined by the type of this Record.

#### 25.2.2.2.1 Index Type Values

The possible values for the *type* field are defined in this table.

Table 25-3 Index Type values

Туре	Value	Size (in bytes)	Alignment
RPM_NULL_TYPE	0	Not Implemented.	
RPM_CHAR_TYPE	1	1	1
RPM_INT8_TYPE	2	1	1
RPM_INT16_TYPE	3	2	2
RPM_INT32_TYPE	4	4	4
RPM_INT64_TYPE	5	Reserved.	
RPM_STRING_TYP E	6	variable, NUL terminated	1

RPM_BIN_TYPE	7	1	1
RPM_STRING_ARR AY_TYPE	8	Variable, sequence of NUL terminated strings	1
RPM_I18NSTRING _TYPE	9	variable, sequence of NUL terminated strings	1

The string arrays specified for entries of type RPM\_STRING\_ARRAY\_TYPE and RPM\_I18NSTRING\_TYPE are vectors of strings in a contiguous block of memory, each element separated from its neighbors by a NUL character.

Index records with type RPM\_I18NSTRING\_TYPE shall always have a *count* of 1. The array entries in an index of type RPM\_I18NSTRING\_TYPE correspond to the locale names contained in the RPMTAG\_HDRI18NTABLE index.

## 25.2.2.2.2 Index Tag Values

Some values are designated as header private, and may appear in any header structure. These are defined here. Additional values are defined in later sections.

**Table 25-4 Header Private Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMTAG_HEA DERSIGNATU RES	62	BIN	16	Optional
RPMTAG_HEA DERIMMUTAB LE	63	BIN	16	Optional
RPMTAG_HEA DERI18NTAB LE	100	STRING_ARR AY		Optional

#### RPMTAG\_HEADERSIGNATURES

The signature tag differentiates a signature header from a metadata header, and identifies the original contents of the signature header.

#### RPMTAG\_HEADERIMMUTABLE

This tag contains an index record which specifies the portion of the Header Record which was used for the calculation of a signature. This data shall be preserved or any header-only signature will be invalidated.

## RPMTAG\_HEADERI18NTABLE

Contains a list of locales for which strings are provided in other parts of the package.

Not all Index records defined here will be present in all packages. Each tag value has a status which is defined here.

#### Required

This Index Record shall be present.

### Optional

This Index Record may be present.

#### Informational

This Index Record may be present, but does not contribute to the processing of the package.

#### Deprecated

This Index Record should not be present.

#### Obsolete

This Index Record shall not be present.

#### Reserved

This Index Record shall not be present.

#### 25.2.2.3 Header Store

The header store contains the values specified by the Index structures. These values are aligned according to their type and padding is used if needed. The store is located immediately following the Index structures.

## 25.2.3 Signature Section

The Signature section is implemented using the Header structure. The signature section defines the following additional tag values which may be used in the Index structures.

These values exist to provide additional information about the rest of the package.

**Table 25-5 Signature Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMSIGTAG_ SIZE	1000	INT32	1	Required
RPMSIGTAG_ PAYLOADSIZ E	1007	INT32	1	Optional

#### RPMSIGTAG\_SIZE

This tag specifies the combined size of the Header and Payload sections.

## RPMSIGTAG\_PAYLOADSIZE

This tag specifies the uncompressed size of the Payload archive, including the cpio headers.

These values exist to ensure the integrity of the rest of the package.

**Table 25-6 Signature Digest Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMSIGTAG_ SHA1	269	STRING	1	Optional
RPMSIGTAG_ MD5	1004	BIN	16	Required

#### RPMSIGTAG\_SHA1

This index contains the SHA1 checksum of the entire Header Section, including the Header Record, Index Records and Header store.

#### RPMSIGTAG\_MD5

This tag specifies the 128-bit MD5 checksum of the combined Header and Archive

sections.

These values exist to provide authentication of the package.

**Table 25-7 Signature Signing Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMSIGTAG_ DSA	267	BIN	65	Optional
RPMSIGTAG_ RSA	268	BIN	1	Optional
RPMSIGTAG_ PGP	1002	BIN	1	Optional
RPMSIGTAG_ GPG	1005	BIN	65	Optional

#### RPMSIGTAG\_DSA

The tag contains the DSA signature of the Header section. The data is formatted as a Version 3 Signature Packet as specified in <a href="RFC 2440"><u>RFC 2440</u></a>: <u>OpenPGP Message Format</u>. If this tag is present, then the SIGTAG\_GPG tag shall also be present.

#### RPMSIGTAG\_RSA

The tag contains the RSA signature of the Header section. The data is formatted as a Version 3 Signature Packet as specified in <u>RFC 2440: OpenPGP Message Format</u>. If this tag is present, then the SIGTAG\_PGP shall also be present.

#### RPMSIGTAG\_PGP

This tag specifies the RSA signature of the combined Header and Payload sections. The data is formatted as a Version 3 Signature Packet as specified in <a href="RFC 2440:OpenPGP Message Format">RFC 2440:OpenPGP Message Format</a>.

## RPMSIGTAG\_GPG

The tag contains the DSA signature of the combined Header and Payload sections. The data is formatted as a Version 3 Signature Packet as specified in <a href="RFC 2440:OpenPGP Message Format">RFC 2440:OpenPGP Message Format</a>.

## 25.2.4 Header Section

The Header section is implemented using the Header structure. The Header section defines the following additional tag values which may be used in the Index structures.

## 25.2.4.1 Package Information

The following tag values are used to indicate information that describes the package as a whole.

**Table 25-8 Package Info Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMTAG_NAM E	1000	STRING	1	Required
RPMTAG_VER SION	1001	STRING	1	Required
RPMTAG_REL EASE	1002	STRING	1	Required
RPMTAG_SUM MARY	1004	I18NSTRING	1	Required
RPMTAG_DES	1005	I18NSTRING	1	Required

	_	·	1	1
CRIPTION				
RPMTAG_SIZ E	1009	INT32	1	Required
RPMTAG_DIS TRIBUTION	1010	STRING	1	Informational
RPMTAG_VEN DOR	1011	STRING	1	Informational
RPMTAG_LIC ENSE	1014	STRING	1	Required
RPMTAG_PAC KAGER	1015	STRING	1	Informational
RPMTAG_GRO UP	1016	I18NSTRING	1	Required
RPMTAG_URL	1020	STRING	1	Informational
RPMTAG_OS	1021	STRING	1	Required
RPMTAG_ARC H	1022	STRING	1	Required
RPMTAG_SOU RCERPM	1044	STRING	1	Informational
RPMTAG_ARC HIVESIZE	1046	INT32	1	Optional
RPMTAG_RPM VERSION	1064	STRING	1	Informational
RPMTAG_COO KIE	1094	STRING	1	Optional
RPMTAG_DIS TURL	1123	STRING	1	Informational
RPMTAG_PAY LOADFORMAT	1124	STRING	1	Required
RPMTAG_PAY LOADCOMPRE SSOR	1125	STRING	1	Required
RPMTAG_PAY LOADFLAGS	1126	STRING	1	Required

## RPMTAG\_NAME

This tag specifies the name of the package.

## RPMTAG\_VERSION

This tag specifies the version of the package.

## ${\tt RPMTAG\_RELEASE}$

This tag specifies the release of the package.

## RPMTAG\_SUMMARY

This tag specifies the summary description of the package. The summary value pointed to by this index record contains a one line description of the package.

## RPMTAG\_DESCRIPTION

This tag specifies the description of the package. The description value pointed to by this index record contains a full desription of the package.

#### RPMTAG\_SIZE

This tag specifies the sum of the sizes of the regular files in the archive.

#### RPMTAG\_DISTRIBUTION

A string containing the name of the distribution on which the package was built.

#### RPMTAG\_VENDOR

A string containing the name of the organization that produced the package.

#### RPMTAG\_LICENSE

This tag specifies the license which applies to this package.

#### RPMTAG\_PACKAGER

A string identifying the tool used to build the package.

#### RPMTAG GROUP

This tag specifies the administrative group to which this package belongs.

#### RPMTAG\_URL

Generic package information URL.

#### RPMTAG\_OS

This tag specifies the OS of the package. The OS value pointed to by this index record shall be "linux".

#### RPMTAG\_ARCH

This tag specifies the architecture of the package. The architecture value pointed to by this index record is defined in architecture specific LSB specification.

#### RPMTAG\_SOURCERPM

This tag specifies the name of the source RPM.

## RPMTAG\_ARCHIVESIZE

This tag specifies the uncompressed size of the Payload archive, including the cpio headers.

## RPMTAG\_RPMVERSION

This tag indicates the version of RPM tool used to build this package. The value is unused.

## RPMTAG\_COOKIE

This tag contains an opaque string whose contents are undefined.

#### RPMTAG\_DISTURL

URL for package.

### RPMTAG\_PAYLOADFORMAT

This tag specifies the format of the Archive section. The format value pointed to by this index record shall be 'cpio'.

### RPMTAG\_PAYLOADCOMPRESSOR

This tag specifies the compression used on the Archive section. The compression value pointed to by this index record shall be 'gzip'.

## RPMTAG\_PAYLOADFLAGS

This tag indicates the compression level used for the Payload. This value shall always be '9'.

#### 25.2.4.2 Installation Information

The following tag values are used to provide information needed during the installation of the package.

**Table 25-9 Installation Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMTAG_PRE IN	1023	STRING	1	Optional
RPMTAG_POS TIN	1024	STRING	1	Optional
RPMTAG_PRE UN	1025	STRING	1	Optional
RPMTAG_POS TUN	1026	STRING	1	Optional
RPMTAG_PRE INPROG	1085	STRING	1	Optional
RPMTAG_POS TINPROG	1086	STRING	1	Optional
RPMTAG_PRE UNPROG	1087	STRING	1	Optional
RPMTAG_POS TUNPROG	1088	STRING	1	Optional

#### RPMTAG\_PREIN

This tag specifies the preinstall scriptlet. If present, then RPMTAG\_PREINPROG shall also be present.

## RPMTAG\_POSTIN

This tag specifies the postinstall scriptlet. If present, then RPMTAG\_POSTINPROG shall also be present.

#### RPMTAG\_PREUN

his tag specifies the preuninstall scriptlet. If present, then RPMTAG\_PREUNPROG shall also be present.

## RPMTAG\_POSTUN

This tag specified the postuninstall scriptlet. If present, then RPMTAG\_POSTUNPROG shall also be present.

## RPMTAG\_PREINPROG

This tag specifies the name of the interpreter to which the preinstall scriptlet will be passed. The interpreter pointed to by this index record shall be /bin/sh.

## RPMTAG\_POSTINPROG

This tag specifies the name of the interpreter to which the postinstall scriptlet will be passed. The interpreter pointed to by this index record shall be /bin/sh.

#### RPMTAG\_PREUNPROG

This tag specifies the name of the intepreter to which the preuninstall scriptlet will

be passed. The interreter pointed to by this index record shall be /bin/sh.

## RPMTAG\_POSTUNPROG

This program specifies the name of the interpreter to which the postuninstall scriptlet will be passed. The interpreter pointed to by this index record shall be /bin/sh.

## 25.2.4.3 File Information

The following tag values are used to provide information about the files in the payload. This information is provided in the header to allow more efficient access of the information.

**Table 25-10 File Info Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMTAG_OLD FILENAMES	1027	STRING_ARR AY		Optional
RPMTAG_FIL ESIZES	1028	INT32		Required
RPMTAG_FIL EMODES	1030	INT16		Required
RPMTAG_FIL ERDEVS	1033	INT16		Required
RPMTAG_FIL EMTIMES	1034	INT32		Required
RPMTAG_FIL EMD5S	1035	STRING_ARR AY		Required
RPMTAG_FIL ELINKTOS	1036	STRING_ARR AY		Required
RPMTAG_FIL EFLAGS	1037	INT32		Required
RPMTAG_FIL EUSERNAME	1039	STRING_ARR AY		Required
RPMTAG_FIL EGROUPNAME	1040	STRING_ARR AY		Required
RPMTAG_FIL EDEVICES	1095	INT32		Required
RPMTAG_FIL EINODES	1096	INT32		Required
RPMTAG_FIL ELANGS	1097	STRING_ARR AY		Required
RPMTAG_DIR INDEXES	1116	INT32		Optional
RPMTAG_BAS ENAMES	1117	STRING_ARR AY		Optional
RPMTAG_DIR NAMES	1118	STRING_ARR AY		Optional

## RPMTAG\_OLDFILENAMES

This tag specifies the filenames when not in a compressed format as determined by the absence of rpmlib(CompressedFileNames) in the RPMTAG\_REQUIRENAME index.

#### RPMTAG\_FILESIZES

This tag specifies the size of each file in the archive.

#### RPMTAG\_FILEMODES

This tag specifies the mode of each file in the archive.

#### RPMTAG\_FILERDEVS

This tag specifies the device number from which the file was copied.

#### RPMTAG\_FILEMTIMES

This tag specifies the modification time in seconds since the epoch of each file in the archive.

#### RPMTAG\_FILEMD5S

This tag specifies the ASCII representation of the MD5 sum of the corresponding file contents. This value is empty if the corresponding archive entry is not a regular file.

#### RPMTAG\_FILELINKTOS

The target for a symlink, otherwise NULL.

#### RPMTAG\_FILEFLAGS

This tag specifies the bit(s) to classify and control how files are to be installed. See below.

#### RPMTAG\_FILEUSERNAME

This tag specifies the owner of the corresponding file.

#### RPMTAG\_FILEGROUPNAME

This tag specifies the group of the corresponding file.

#### RPMTAG FILEDEVICES

This tag specifies the 16 bit device number from which the file was copied.

## RPMTAG\_FILEINODES

This tag specifies the inode value from the original file system on the the system on which it was built.

## RPMTAG\_FILELANGS

This tag specifies a per-file locale marker used to install only locale specific subsets of files when the package is installed.

### RPMTAG\_DIRINDEXES

This tag specifies the index into the array provided by the RPMTAG\_DIRNAMES Index which contains the directory name for the corresponding filename.

## RPMTAG\_BASENAMES

This tag specifies the base portion of the corresponding filename.

#### RPMTAG\_DIRNAMES

One of RPMTAG\_OLDFILENAMES or the tuple RPMTAG\_DIRINDEXES, RPMTAG\_BASE-NAMES, RPMTAG\_DIRNAMES shall be present, but not both.

#### 25.2.4.3.1 File Flags

The RPMTAG\_FILEFLAGS tag value shall identify various characteristics of the file in the payload that it describes. It shall be an INT32 value consisting of either the value RPMFILE\_NONE (0) or the bitwise inclusive or of one or more of the following values:

Table 25-11 File Flags

Name	Value
RPMFILE_CONFIG	(1 << 0)
RPMFILE_DOC	(1 << 1)
RPMFILE_DONOTUSE	(1 << 2)
RPMFILE_MISSINGOK	(1 << 3)
RPMFILE_NOREPLACE	(1 << 4)
RPMFILE_SPECFILE	(1 << 5)
RPMFILE_GHOST	(1 << 6)
RPMFILE_LICENSE	(1 << 7)
RPMFILE_README	(1 << 8)
RPMFILE_EXCLUDE	(1 << 9)

These bits have the following meaning:

#### RPMFILE\_CONFIG

The file is a configuration file, and an existing file should be saved during a package upgrade operation and not removed during a pakage removal operation.

#### RPMFILE\_DOC

The file contains documentation.

#### RPMFILE DONOTUSE

This value is reserved for future use; conforming packages may not use this flag.

## RPMFILE\_MISSINGOK

The file need not exist on the installed system.

#### RPMFILE\_NOREPLACE

Similar to the RPMFILE\_CONFIG, this flag indicates that during an upgrade operation the original file on the system should not be altered.

#### RPMFILE\_SPECFILE

The file is a package specification.

## RPMFILE\_GHOST

The file is not actually included in the payload, but should still be considered as a part of the package. For example, a log file generated by the application at run time.

#### RPMFILE\_LICENSE

The file contains the license conditions.

#### RPMFILE\_README

The file contains high level notes about the package.

## RPMFILE\_EXCLUDE

The corresponding file is not a part of the package, and should not be installed.

## 25.2.4.4 Dependency Information

The following tag values are used to provide information about interdependencies between packages.

**Table 25-12 Package Dependency Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMTAG_PRO VIDENAME	1047	STRING_ARR AY	1	Required
RPMTAG_REQ UIREFLAGS	1048	INT32		Required
RPMTAG_REQ UIRENAME	1049	STRING_ARR AY		Required
RPMTAG_REQ UIREVERSIO N	1050	STRING_ARR AY		Required
RPMTAG_CON FLICTFLAGS	1053	INT32		Optional
RPMTAG_CON FLICTNAME	1054	STRING_ARR AY		Optional
RPMTAG_CON FLICTVERSI ON	1055	STRING_ARR AY		Optional
RPMTAG_OBS OLETENAME	1090	STRING_ARR AY		Optional
RPMTAG_PRO VIDEFLAGS	1112	INT32		Required
RPMTAG_PRO VIDEVERSIO N	1113	STRING_ARR AY		Required
RPMTAG_OBS OLETEFLAGS	1114	INT32	1	Optional
RPMTAG_OBS OLETEVERSI ON	1115	STRING_ARR AY		Optional

## RPMTAG\_PROVIDENAME

This tag indicates the name of the dependency provided by this package.

## RPMTAG\_REQUIREFLAGS

Bits(s) to specify the dependency range and context.

## RPMTAG\_REQUIRENAME

This tag indicates the dependencies for this package.

## RPMTAG\_REQUIREVERSION

This tag indicates the versions associated with the values found in the RPMTAG\_REQUIRENAME Index.

## RPMTAG\_CONFLICTFLAGS

Bits(s) to specify the conflict range and context.

## RPMTAG\_CONFLICTNAME

This tag indicates the conflicting dependencies for this package.

#### RPMTAG\_CONFLICTVERSION

This tag indicates the versions associated with the values found in the RPMTAG\_CONFLICTNAME Index.

## RPMTAG\_OBSOLETENAME

This tag indicates the obsoleted dependencies for this package.

#### RPMTAG\_PROVIDEFLAGS

Bits(s) to specify the conflict range and context.

#### RPMTAG\_PROVIDEVERSION

This tag indicates the versions associated with the values found in the RPMTAG\_PROVIDENAME Index.

#### RPMTAG\_OBSOLETEFLAGS

Bits(s) to specify the conflict range and context.

#### RPMTAG\_OBSOLETEVERSION

This tag indicates the versions associated with the values found in the RPMTAG\_OBSOLETENAME Index.

### 25.2.4.4.1 Package Dependency Values

The package dependencies are stored in the RPMTAG\_REQUIRENAME and RPMTAG\_REQUIREVERSION index records. The following values may be used.

Table 25-13 Index Type values

Name	Version	Meaning	Status
rpmlib(Versioned Dependencies)	3.0.3-1	Indicates that the package contains RPMTAG_PROVIDE NAME, RPMTAG_OBSOLET ENAME or RPMTAG_PREREQ records that have a version associated with them.	Optional
rpmlib(PayloadFil esHavePrefix)	4.0-1	Indicates the filenames in the Archive have had "." prepended to them.	Optional
rpmlib(Compresse dFileNames)	3.0.4-1	Indicates that the filenames in the Payload are represented in the RPMTAG_DIRINDE XES, RPMTAG_DIRNAME and RPMTAG_BASENAM ES indexes.	Optional

/bin/sh	Interpreter usually required for	Optional
	installation scripts.	

Additional dependencies are specified in the Package Dependencies section of this specification, and in the relevant architecture specific part of the LSB Core Specification.

## 25.2.4.4.2 Package Dependencies Attributes

The package dependency attributes are stored in the RPMTAG\_REQUIREFLAGS, RP-MTAG\_PROVIDEFLAGS and RPMTAG\_OBSOLETEFLAGS index records. The following values may be used.

**Table 25-14 Package Dependency Attributes** 

Name	Value	Meaning
RPMSENSE_LESS	0x02	
RPMSENSE_GREATER	0x04	
RPMSENSE_EQUAL	0x08	
RPMSENSE_PREREQ	0×40	
RPMSENSE_INTERP	0x100	
RPMSENSE_SCRIPT_PRE	0x200	
RPMSENSE_SCRIPT_POS T	0×400	
RPMSENSE_SCRIPT_PRE UN	0×800	
RPMSENSE_SCRIPT_POS TUN	0×1000	
RPMSENSE_RPMLIB	0x1000000	

## 25.2.4.5 Other Information

The following tag values are also found in the Header section.

**Table 25-15 Other Tag Values** 

Name	Tag Value	Туре	Count	Status
RPMTAG_BUI LDTIME	1006	INT32	1	Informational
RPMTAG_BUI LDHOST	1007	STRING	1	Informational
RPMTAG_FIL EVERIFYFLA GS	1045	INT32		Optional
RPMTAG_CHA NGELOGTIME	1080	INT32		Optional
RPMTAG_CHA NGELOGNAME	1081	STRING_ARR AY		Optional
RPMTAG_CHA NGELOGTEXT	1082	STRING_ARR AY		Optional
RPMTAG_OPT FLAGS	1122	STRING	1	Informational
RPMTAG_RHN PLATFORM	1131	STRING	1	Deprecated
RPMTAG_PLA TFORM	1132	STRING	1	Informational

#### RPMTAG\_BUILDTIME

This tag specifies the time as seconds since the epoch at which the package was built

#### RPMTAG\_BUILDHOST

This tag specifies the hostname of the system on which which the package was built.

#### RPMTAG\_FILEVERIFYFLAGS

This tag specifies the bit(s) to control how files are to be verified after install, specifying which checks should be performed.

#### RPMTAG\_CHANGELOGTIME

This tag specifies the Unix time in seconds since the epoch associated with each entry in the Changelog file.

#### RPMTAG\_CHANGELOGNAME

This tag specifies the name of who made a change to this package.

#### RPMTAG\_CHANGELOGTEXT

This tag specifies the changes associated with a changelog entry.

#### RPMTAG\_OPTFLAGS

This tag indicates additional flags which may have been passed to the compiler when building this package.

#### RPMTAG\_RHNPLATFORM

This tag contains an opaque string whose contents are undefined.

## RPMTAG\_PLATFORM

This tag contains an opaque string whose contents are undefined.

## 25.2.5 Payload Section

The Payload section contains a compressed cpio archive. The format of this section is defined by RFC 1952: GZIP File Format Specification.

When uncompressed, the cpio archive contains a sequence of records for each file. Each record contains a CPIO Header, Filename, Padding, and File Data.

**Table 25-16 CPIO File Format** 

CPIO Header	Header structure as defined below.
Filename	NUL terminated ASCII string containing the name of the file.
Padding	0-3 bytes as needed to align the file stream to a 4 byte boundary.
File data	The contents of the file.
Padding	0-3 bytes as needed to align the file stream to a 4 byte boundary.

The CPIO Header uses the following header structure (sometimes referred to as "new ASCII" or "SVR4 cpio"). All numbers are stored as ASCII representations of their hexadecimal value with leading zeros as needed to fill the field. With the exception of *c\_namesize* and the corresponding name string, and *c\_checksum*, all information contained in the CPIO Header is also represented in the Header Section. The values in

the CPIO Header shall match the values contained in the Header Section.

```
struct {
    char c_magic[6];
    char c_ino[8];
    char c_mode[8];
    char c_uid[8];
    char c_gid[8];
    char c_nlink[8];
    char c_mtime[8];
    char c_filesize[8];
    char c_devmajor[8];
    char c_devminor[8];
    char c_rdevmajor[8];
    char c_rdevminor[8];
    char c_namesize[8];
    char c_checksum[8];
};
```

#### c\_magic

Value identifying this cpio format. This value shall be "070701".

#### c ino

This field contains the inode number from the filesystem from which the file was read. This field is ignored when installing a package. This field shall match the corresponding value in the RPMTAG\_FILEINODES index in the Header section.

#### c\_mode

Permission bits of the file. This is an ascii representation of the hexadecimal number representing the bit as defined for the *st\_mode* field of the stat structure defined for the stat function. This field shall match the corresponding value in the RPMTAG\_FILEMODES index in the Header section.

## c\_uid

Value identifying this owner of this file. This value matches the uid value of the corresponding user in the RPMTAG\_FILEUSERNAME as found on the system where this package was built. The username specified in RPMTAG\_FILEUSER-NAME should take precedence when installing the package.

#### $c_gid$

Value identifying this group of this file. This value matches the gid value of the corresponding user in the RPMTAG\_FILEGROUPNAME as found on the system where this package was built. The groupname specified in RPMTAG\_FILEGROUPNAME should take precedence when installing the package.

#### c\_nlink

Value identifying the number of links associated with this file. If the value is greater than 1, then this filename will be linked to 1 or more files in this archive that has a matching value for the c\_ino, c\_devmajor and c\_devminor fields.

#### c\_mtime

Value identifying the modification time of the file when it was read. This field shall match the corresponding value in the RPMTAG\_FILEMTIMES index in the Header section.

## c\_filesize

Value identifying the size of the file. This field shall match the corresponding value

in the RPMTAG\_FILESIZES index in the Header section.

#### c\_devmajor

The major number of the device containing the file system from which the file was read. With the exception of processing files with c\_nlink >1, this field is ignored when installing a package. This field shall match the corresponding value in the RPMTAG\_FILEDEVICES index in the Header section.

#### c\_devminor

The minor number of the device containing the file system from which the file was read. With the exception of processing files with c\_nlink >1, this field is ignored when installing a package. This field shall match the corresponding value in the RPMTAG\_FILEDEVICES index in the Header section.

#### c\_rdevmajor

The major number of the raw device containing the file system from which the file was read. This field is ignored when installing a package. This field shall match the corresponding value in the RPMTAG\_RDEVS index in the Header section.

#### c\_rdevminor

The minor number of the raw device containing the file system from which the file was read. This field is ignored when installing a package. This field shall match the corresponding value in the RPMTAG\_RDEVS index in the Header section.

#### c\_namesize

Value identifying the length of the filename, which is located immediately following the CPIO Header structure.

#### c\_checksum

Value containing the CRC checksum of the file data. This field is not used, and shall contain the value "00000000". This field is ignored when installing a package.

A record with the filename "TRAILER!!!" indicates the last record in the archive.

## 25.3 Package Script Restrictions

Scripts used as part of the package install and uninstall shall only use commands and interfaces that are specified by the LSB. All other commands are not guaranteed to be present, or to behave in expected ways.

Packages shall not use RPM triggers.

Packages shall not depend on the order in which scripts are executed (pre-install, pre-uninstall, etc), when doing an upgrade.

## 25.4 Package Tools

The LSB does not specify the interface to the tools used to manipulate LSB-conformant packages. Each conforming implementation shall provide documentation for installing LSB packages.

## 25.5 Package Naming Conventions

Packages supplied by distributions and applications should adhere to the following conventions for the name field within the package. The rules are optional for the filename of the package file itself.

**Note:** There are discrepancies among implementations concerning whether the name might be frobnicator-1.7-21-ppc32.rpm or frobnicator-1.7-21-powerpc32.rpm. The architecture aside, recommended practice is for the filename of the package file to match the

name within the package.

The following conventions apply to the name portion of the field alone, not including any release or version portion.

**Note:** If the package name with the release and version is frobnicator-1.7-21, the name part is frobnicator and falls under the conventions for a name with no hyphens.

- If the name begins with 1sb- and contains no other hyphens, the name should be a package name registered with the Linux Assigned Names and Numbers Authority (http://www.lanana.org) (LANANA), which shall maintain a registry of LSB names. The name may be registered by either an implementation or an application.
- If the name begins with 1sb- and contains more than one hyphen the portion of the name between the first and second hyphens should be either an LSB provider name registered with the LANANA (for example 1sb-gnome-gnumeric if gnome is registered), or a domain name registered to the provider in the DNS system. (for example 1sb-distro.example.com-database). The LSB provider name registered with the LANANA shall only consist of the ASCII characters [a-z0-9]. The domain name, in accordance with DNS rules, shall be lower case only. The provider name or domain name may be either that of a distribution or an application.
- Package names containing no hyphens are reserved for use by distributions.
   Applications shall not use such names.
- Package names which do not start with 1sb- and which contain a hyphen are open to
  both distributions and applications. Distributions may name packages in any part of
  this namespace. They are encouraged to use names from one of the other namespaces
  available to them, but this is not mandatory due to the large amount of current
  practice to the contrary.

**Note:** Widespread existing practice includes such names as ssh-common, ssh-client, kernel-pcmcia, and the like. Possible alternative names include sshcommon, foolinux-ssh-common (where foolinux is registered to the distribution), or lsb-foolinux-ssh-common.

Applications may name their packages this way, but only if the portion of the name before the first hyphen is a provider name or registered domain name as described above.

**Note:** If an application vendor has domain name such as visicalc.example.com and has registered visicalc as a provider name, they could name packages either in the visicalc-base style or the visicalc.example.com-charting style.

Package names in this namespace are available to both the distribution and an application. Distributions and applications need to consider the potential for conflicts when deciding to use these names rather than the alternatives (such as names starting with 1sb-).

## 25.6 Package Dependencies

Packages shall have a dependency that indicates which LSB modules are required. LSB module descriptions are dash seperated tuples containing the name 'lsb', the module name, and the architecture name. The following dependencies may be used.

#### lsb-core

This dependency is used to indicate that the application is dependent on features contained in the LSB Core specification.

## lsb-core-arch

This dependency is used to indicate that the application is dependent on features contained in the LSB Core specification and that the package contains architecture specific features. This architecture specific dependency is described in the relevant

architecture specific part of the LSB Core specification.

#### lsb-core-noarch

This dependency is used to indicate that the application is dependent on features contained in the LSB Core specification and that the package does not contain any architecture specific files.

These dependencies shall have a version of 5.0.

Packages shall not depend on other system-provided dependencies. They shall not depend on non-system-provided dependencies unless the package provider also makes available the LSB conforming packages needed to satisfy such dependencies.

Other modules in the LSB may supplement this list. The architecture specific dependencies are described in the relevant architecture specific LSB.

## 25.7 Package Architecture Considerations

Packages which do not contain any architecture specific files should specify an architecture of noarch. An LSB runtime environment shall accept values noarch, or the value specified in the relevant architecture specific part of the LSB Core Specification.

Additional specifications or restrictions may be found in the architecture specific LSB specification.

# **Annex A Alphabetical Listing of Interfaces by Library**

## A.1 libc

The behavior of the interfaces in this library is specified by the following Standards.

Large File Support [LFS]

This Specification [LSB]

<u>RFC 5531/4506 RPC & XDR</u> [RPC + XDR]

SUSv2 [SUSv2]

POSIX 1003.1-2001 (ISO/IEC 9945-2003) [SUSv3]

POSIX 1003.1-2008 (ISO/IEC 9945-2009) [SUSv4]

SVID Issue 4 [SVID.4]

## **Table A-1 libc Function Interfaces**

#### **Table A-7 libm Data Interfaces**

signgam[SUSv4]		

## A.6 libncurses

The behavior of the interfaces in this library is specified by the following Standards. This Specification [LSB]

X/Open Curses, Issue 7 [X-CURSES]

## **Annex B GNU Free Documentation License (Informative)**

This specification is published under the terms of the GNU Free Documentation License, Version 1.1, March 2000

Copyright (C) 2000 Free Software Foundation, Inc. 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

### **B.1 PREAMBLE**

The purpose of this License is to make a manual, textbook, or other written document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

#### **B.2 APPLICABILITY AND DEFINITIONS**

This License applies to any manual or other work that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you".

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (For example, if the Document is in part a text-book of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, whose contents can be viewed and edited directly and straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup has been designed to thwart or discourage subsequent modification by readers is not Transparent. A copy that is not "Transparent"

License (Informative)

is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML designed for human modification. Opaque formats include PostScript, PDF, proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

#### **B.3 VERBATIM COPYING**

You may copy and distribute the Document in any medium, either commercially or non-commercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

#### **B.4 COPYING IN QUANTITY**

If you publish printed copies of the Document numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a publicly-accessible computer-network location containing a complete Transparent copy of the Document, free of added material, which the general network-using public has access to download anonymously at no charge using public-standard network protocols. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

#### **B.5 MODIFICATIONS**

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
- B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has less than five).
- C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
- D. Preserve all the copyright notices of the Document.
- E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
- F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
- G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
- H. Include an unaltered copy of this License.
- I. Preserve the section entitled "History", and its title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
- J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
- K. In any section entitled "Acknowledgements" or "Dedications", preserve the section's title, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
- L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
- M. Delete any section entitled "Endorsements". Such a section may not be included in the Modified Version.
- N. Do not retitle any existing section as "Endorsements" or to conflict in title with any Invariant Section.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These

License (Informative)

titles must be distinct from any other section titles.

You may add a section entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties--for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

### **B.6 COMBINING DOCUMENTS**

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work

In the combination, you must combine any sections entitled "History" in the various original documents, forming one section entitled "History"; likewise combine any sections entitled "Acknowledgements", and any sections entitled "Dedications". You must delete all sections entitled "Endorsements."

#### **B.7 COLLECTIONS OF DOCUMENTS**

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

#### **B.8 AGGREGATION WITH INDEPENDENT WORKS**

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, does not as a whole count as a Modified Version of the Document, provided no compilation copyright is claimed for the compilation. Such a compilation is called an "aggregate", and this License does not apply to the other self-contained works thus compiled with the Document, on account of their being thus compiled, if they are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one quarter of the entire aggregate, the Document's Cover Texts may be placed on covers that surround only the Document within the aggregate. Otherwise they must appear on covers around the whole aggregate.

#### **B.9 TRANSLATION**

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License provided that you also include the original English version of this License. In case of a disagreement between the translation and the original English version of this License, the original English version will prevail.

#### **B.10 TERMINATION**

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

#### **B.11 FUTURE REVISIONS OF THIS LICENSE**

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

### B.12 How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright (c) YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.1 or any later version published by the Free Software Foundation; with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have no Invariant Sections, write "with no Invariant Sections" instead of saying which ones are invariant. If you have no Front-Cover Texts, write "no Front-Cover Texts" instead of "Front-Cover Texts being LIST"; likewise for Back-Cover Texts.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
